3065. Meeting place.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-13 02:04:59 UTC
From: Jeff Melanson
Topic: 3065 Message: 3065

Justin,

At the last meeting you mentioned that you might have a place for us to meet in Nampa. Were you able to find out more about that? Currently the next meeting location is Hobby Town but if you have a place in Nampa it would be an easier drive for our distant members.

Hi all,

The crystal Craig sent me arrived in the mail yesterday. I
installed it and my TNC is working good. Thanks for the
crystal Craig!

Cool. Besides the PCB developing a crack, the crystal is
about the only thing that can be bothered by a smack like
your TNC received when it landed at sans-parachute terminal
velocity.

Let's be thankful we don't have tube stuff (I have an
antique radiosonde that uses little tubes).

I checked into it but the Sleep Inn requires appointment in advance and a fee. I know the Denny's at the sugar beet exit has a "conference" area and I asked an employee there. She didn't think there was a fee for it, just advance notice to reserve it. Other than that, I think Jade Garden is our best option for now. I'll keep checking around though. What ever happened to meeting at that pizza place near Caldwell, near the auction grounds? Too far off the beaten path?

Justin,

We try to meet at places where we can work on projects.
That's hard to do at a restaurant.

Jeff,

Nampa doesn't really have much to offer in the way of a hobby store. The only thing close that I can think of is Mac's craft store next to Staples. I know they have amateur sewing and painting classes in their back hobby room area. If I have time, I'll see what they can do for an amateur balloon group. I just started work and summer school so available free time has been dramatically cut.

Subject: [tvnsp] Garmin GPS35 LVS and GPS35 HVS Units

Hi everyone,

I have firm quotes now from the sellers of these two units. There are 8 LVS units available and 32 HVS units. The LVS units are OEM (which means the cabling is bare, you add your own serial connector & power connector). Price is $106 each plus shipping to you for the LVS and $80 plus shipping to me and to you on the HVS (probably around $90 plus or minus a few bucks). For those out of the Treasure Valley who inquired I will ship to you in one box for your distribution to your groups. I need to know from everyone how many of each model you want. I'll send you back your total and will need payment right away as I obviously can not front this much money myself.

Hope this helps everyone out in your search for these units.

3077. GPS-35 order

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-14 14:30:40 UTC
From: Mark Conner
Topic: 3077 Message: 3077

Stephanie,

When are you expecting to place the order? I may have two or three from here, but TVNSP has first priority of course. Do you have PayPal?

On a separate note, glad to hear the crystal thing worked out. By the time I had a chance to dig out my KPC-3, you had it installed and working.

- Mark

3078. Re: [tvnsp] Double post's

Jeff

I thought about my last comment and decided it was not
a good idea after i posted it.

I will have to post here from work if i want to keep
current on the discussions. Don't have enough hours
in the day when i get home to check email. Honey do's
always take precedence ;-(

After Hank's comment that he did not see doubles from me
i thought, "Oh Heck" everyone else has a delete key anyway.

Thanks for the observation Jeff. I will keep working on it.

PS, Great to see your KPC+ lives again !! It was great to
see everyone chip in and offer crystals. Maybe we ought
to start a "Crystal Blood Bank" for ballooners ;-)

Topic: 3076 Message: 3079

> After Hank's comment that he did not see doubles from me
> i thought, "Oh Heck" everyone else has a delete key anyway.

Just to put that in context, what I mentioned to Jeff and Randy is that the yahoogroups *webpage* is not registering double posts. I don't get email from TVNSP; I read from the website.

It later occurred to me that yahoogroups may have smart software that blocks redundant posts so that could be the explanation.

Folks, another gentle reminder to take a second to trim dangling garbage from old messages when you make replies. It's so easy to do and makes real nice looking replies that you can be proud of. :)

Hank

Hi Mark,

PayPal will be an extra cost option (I have to pay a small percentage of the transaction amount to get the money as I have a commercial account) and there is no problem with whatever you guys need of the HVS as there are copious quantities of them. I would like to send in the order no later than Monday so try and get the quantities to me by then. I'll send payment instructions once I know what each person wants.

I'll put you down for 10. I need to keep it a all-in-one order as that
is how I negotiated the deal. I'll let you know the total as soon as all
the orders are in.

Ok TVNSP gang, they are going fast now. Get your orders in!!!

Hi Mark,

That was me with the crystal thing. Thanks for the offer
anyway. Don't lose those crystals just in case.

I believe you used a TinyTrackII in one of your flights. How
did that work out? I'm planning on using one in the future
and want to know if there's any gotcha's.

The main "gotcha" to watch out for is too much RF back into the TinyTrak unit. This will lock it up, usually in a key-down mode. So make sure you test the unit in its flight orientation and power levels.

From: Mark Conner
Topic: 3087 Message: 3087

I flew 2 of their 650's (NWS standard). The main difference is
that
for at least that size, the neck is substantially larger. I
think I
used 1-1/4" PVC pipe for a fill hose - need to verify this.
Check my
2000 flights for results at
http://members.cox.net/mconner1/nstar2000-01.html .

Also, Kaysams are a two-piece balloon. The neck is one piece and
the
round part of the balloon is another. They're joined by a
lightweight
plastic ring. I think I still have the remnants of one and can
e-mail
a picture.

3090. More GPSL frequency coordination items

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-18 04:11:49 UTC
From: Mark Conner
Topic: 3090 Message: 3090

A few questions for some of the groups planning to fly next month.

I define "time-slotting" as the ability to keep your transmissions between X and Y seconds after the minute, using the time reported in the NMEA output from your GPS.

EOSS: Can your 144.34 payload time-slot its beacons? What callsigns will you be using?

TVNSP: I believe you're using the KPC-3+ second serial port to control transmissions for your 144.34 payload - is this correct? If so, you can therefore time-slot. Are you planning to fly a backup beacon - if so on what frequency? What callsigns will be used?

WB8ELK: Can you time-slot your 144.34 beacons? If not, does it beacon every X seconds, or is it semi-random? What call do you plan to use?

KD0FW: Is it OK to change your simplex repeater to 147.585, or do you have another frequency you'd prefer?

Traveler: You sent me e-mail earlier that your programming will not time-slot. Is it every X seconds, or semi-random? I think as long as it's not too close to 60 seconds for a repeat interval we shouldn't have a problem.

ANSR: since you're transmitting on 70cm you can set up your telemetry as you wish.

I would like to use a 70cm frequency for chase comms - if we use 2m we'll desense our data reception (though ANSR has the opposite problem). We'll probably select a convenient "rally point" near the predicted landings for everyone to head towards after they recover their payloads so everyone knows where to go if they lose comm with the rest. Depending on where we end up going, cell phone coverage ranges fair to none. I have no problems using the NSTAR simplex repeater (if it flies) as a chase frequency - this will let distant stations listen in on the fun.

Once I get answers back on the above, I'll work out a strawman proposal for the division of clock times and intervals to be used.

73 de Mark N9XTN

3091. Re: [tvnsp] More GPSL frequency coordination items

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-18 17:37:26 UTC
From: Zack Clobes
Topic: 3090 Message: 3091

Currently, we transmit the following:
GPGGA
wait 2 seconds
GPRMC
wait about 30 seconds
GPGGA
wait 2 seconds
GPRMC
wait 2 seconds
Telemetry data
wait about 30 seconds
repeat.

I guess to answer your question, yes, we are constantly revolving and shouldn't get stuck on top of any one slot. I think maybe we should drop one of our RMC's for this flight though.

ANSR: since you're transmitting on 70cm you can set up your telemetry as you wish.

I would like to use a 70cm frequency for chase comms - if we use 2m we'll desense our data reception (though ANSR has the opposite problem). We'll probably select a convenient "rally point" near the predicted landings for everyone to head towards after they recover their payloads so everyone knows where to go if they lose comm with the rest. Depending on where we end up going, cell phone coverage ranges fair to none. I have no problems using the NSTAR simplex repeater (if it flies) as a chase frequency - this will let distant stations listen in on the fun.

Once I get answers back on the above, I'll work out a strawman proposal for the division of clock times and intervals to be used.

From: Mark Conner
Topic: 3087 Message: 3092

I flew 2 of their 650's (NWS standard). The main difference is that for at least that size, the neck is substantially larger. I think I used 1-1/4" PVC pipe for a fill hose - need to verify this. Check my 2000 flights for results at http://members.cox.net/mconner1/nstar2000-01.html .

Also, Kaysams are a two-piece balloon. The neck is one piece and the round part of the balloon is another. They're joined by a lightweight plastic ring. I think I still have the remnants of one and can e-mail a picture.

I got back last night. I need to leave again on Monday. Is anyone interested in meeting before then to discuss GPSL? We also need to set the next TVNSP launch date.

For then remainder of this week, I'm going to focus on GPSL.

Paul

Paul,

Did you hear about the GPS 35 units I found? I am placing the order later today for them. If you missed it the deal is GPS35 LVS units for $100 and GPS35 HVS units for just under that. Let me know if you want in.

Hi TVNSP,

I just spoke to Paul on the phone. We want to have a meeting while he is in town. We will meet at Jade Garden at 6:30 pm on Friday. Paul will be discussing what his plans are for the Great Plains Super Launch. We will also discuss plans for future flights.
One other topic will be our meeting format. It has been noted that our construction meetings are not to efficient. This is because we don't get as much work done at these meetings for the amount of time spent as we do at home. Also not everyone is interested in building a capsule. Some of us don't necessarily want to build a capsule but would rather do other things such as launch and chase crew or operate a home base station. The meetings should be more for the business end of things and for training. Training would be things like flight predictions using balloon track, how to forecast, launch procedures, learning the BASIC stamp, using liftwin, etc. With this format we can hold our meetings at a more centrally located place to where we all live. For those of us doing construction we can meet elsewhere. Let's all come to Friday's meeting and put in our two cents worth.
For those of us doing capsule construction we are meeting at my house on Saturday at 10 am. Stephanie will be bringing her capsule, Randy will bring his radio for the antenna mod. Paul will be bringing his stuff and I will be working on my APRS only small capsule. Anyone else have a project you need help on? Bring it with you.

Please reply if you are coming to the Friday meeting so we have an idea of how many will be there.

Jeff

I forgot that i have Field Day commitments this weekend.
I volunteered to demonstrating APRS and Balloon tracking.
to interested visitors. Have old balloon data i can
display on the maps for people to see.

We covered a lot of topics last week, so i don't feel
i will miss too much, except for the camaraderie.
I can save the radio mod. for next time.

3100. Garmin GPS35 HVS & LVS - Payment Instructions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-19 18:43:13 UTC
From: Stephanie Steele
Topic: 3100 Message: 3100

Hi members/friends of TVNSP,

Ok, this deal is finally done. Here are the payment details. Please pay close attention to the PayPal information if you intend to pay that way. Two have already paid me to the wrong account. Please use the one listed below.

For the HVS units:

Price delivered when I see you - $83.00
Price with shipping - $89.00
Price with shipping using PayPal - $92.30

For the LVS units:

Price delivered when I see you - $106.00
Price with shipping - $112.00
Price with shipping using PayPal - $115.30

Send PayPal payments to:

kc7dba@...

If you wish to send a check or money order the address is:

Stephanie Steele
817 Orchard Park Drive
Fruitland, ID 83619

If you ordered more than one unit just add the above amounts. Yes, I will pocket any excess shipping in these instances. I am still working on getting some small accessories for these so you MAY find something extra in your package. With the number of these that I am going to handle I can't afford the time to break it down any more than this. This went from a small project to a 30+ order so I hope you can understand. Hope this does not offend anyone but it's just reality.

Here are the persons I have on the list. If you are not on here and wish one, drop me a note but do not pay for it. I will let you know once the dust settles if there are any left. Please excuse if I misspell your name as I am working off a scratch list. Also, if you have not specified HVS or LVS please let me know right away or you may lose yours.

BTW, donations to the 'you are sure great to do this Stephanie' fund are gladly accepted ;-)

3104. Big ole government balloon may be in the hood Saturday

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-20 03:33:50 UTC
From: Hank Riley
Topic: 3104 Message: 3104

This government balloon program has a fair amount of cancellations,
but if this one goes up it will be a biggie! This is a post from
the EOSS balloon list.

Hank

Hi Cec,

Wow! 48 hrs puts you on the deck Saturday - and western Idaho
looks like a great recovery site. I'll pass the word to
Paul Verhage in Boise - he's a very experienced balloonist.
You'll be beaconing APRS on 144.39 as KB0TVJ-11, right?

Good luck and happy landings!

Mike

As of 6 PM, We are on a 24 hr hold and are going to work at the normal time tomorrow morning. We hope to launch Friday morning. Originally it was to come down somewhere around Grangeville, but the last prediction is SE Washington. We will see what happens in the morning. We have 3 separate trackers, with 2 on government frequencies & one National APRS. I can post a jpg of the predicted path tomorrow night if anyone wants it.

The web site for this project is at: http://www-frd.fsl.noaa.gov/mab/sdb/

WOW!, what great timing.
This will be perfect for My Field Day demonstration
station if it stays on schedule. Got a couple of
young hams planning on attending, so this should
light their fire.

Only downside,i would love to go track it too.

Thanks for posting Hank. Glad someone has the time to keep
abreast of all the balloon stuff.

Good luck Craig and the crew.

3109. [tvnsp] Garmin GPS35 HVS & LVS - Payment Instructions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-20 15:41:13 UTC
From: Stephanie Steele
Topic: 3100 Message: 3109

Hi members/friends,

Thanks to those who have paid or sent information regarding their payment method. To the others, please pay up asap. I have $3000+ hanging out based upon your stated committments. Just in case you missed them, here are the payment details. Please pay close attention to the PayPal information if you intend to pay that way. I really prefer this payment method if you are interested. It really simplifies things for handling these payments. If you are using PayPal please use the account listed below.

For the HVS units:

Price delivered when I see you - $83.00
Price with shipping - $89.00
Price with shipping using PayPal - $92.30

For the LVS units:

Price delivered when I see you - $106.00
Price with shipping - $112.00
Price with shipping using PayPal - $115.30

Send PayPal payments to:

kc7dba@...

If you wish to send a check or money order the address is:

Stephanie Steele
817 Orchard Park Drive
Fruitland, ID 83619

If you ordered more than one unit just add the above amounts. Yes, I will pocket any excess shipping in these instances. I am still working on getting some small accessories for these so you MAY find something extra in your package. With the number of these that I am going to handle I can't afford the time to break it down any more than this. This went from a small project to a 30+ order so I hope you can understand. Hope this does not offend anyone but it's just reality.

Here are the persons I have on the list. If you are not on here and wish one, drop me a note but do not pay for it. I will let you know once the dust settles if there are any left. Please excuse if I misspell your name as I am working off a scratch list. Also, if you have not specified HVS or LVS please let me know right away or you may lose yours.

BTW, donations to the 'you are sure great to do this Stephanie' fund are gladly accepted ;-)

Hi Cec,

Wow! 48 hrs puts you on the deck Saturday - and western Idaho
looks like a great recovery site. I'll pass the word to
Paul Verhage in Boise - he's a very experienced balloonist.
You'll be beaconing APRS on 144.39 as KB0TVJ-11, right?

Good luck and happy landings!

Mike

We tried very hard to shove the balloon out the end of the hangar today, but it kept coming back.....;-)
We will send it up bright & early Friday.

With it going till Sunday morning, you should be able to see it from the Field Day site.

It will be going further North towards Spokane, according to the last plot I saw. They will do another at midnight & one in the morning to see where to chase it. Who knows, it may turn around & head South. We will see. I will try to send out another direction in the morning, if I have time & can get to my work PC.

Have a good weekend-

3118. GAINS flight status?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-21 16:44:27 UTC
From: Mark Conner
Topic: 3118 Message: 3118

The APRS payload appears to be transmitting now (1639 UTC) but the posits contain two-day-old data. Maybe the GPS is not connected to the KPC-3.

Here is the GAINS tracking page:
http://www-frd.fsl.noaa.gov/mab/sdb/gains_rt.htm

Can't tell if this data is accurate or not - the altitude doesn't appear to be.

73 de Mark N9XTN

KB0TVJ-11>APRS,N7IFJ-10*,WIDE3-2:$GPGGA,190534,4525.1671,N,12348.3041,W,1,07,0.91,17.3,M,-20.6,M,,*74
KB0TVJ-11>APRS,W7PLK-10*,WIDE3-1:$GPRMC,190534,A,4525.1671,N,12348.3041,W,0.000,0.0,180602,18.3,E*54

3119. KB0TVJ-11 updating now

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-21 16:49:39 UTC
From: Mark Conner
Topic: 3119 Message: 3119

Right after I sent it, I got good data (I think).

Balloon is ascending through 6000 ft and moving SW just off the coast.

73 de Mark N9XTN

3120. GAINS flight ascent rate

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-21 17:17:04 UTC
From: Mark Conner
Topic: 3120 Message: 3120

I've been monitoring the GAINS flight on findu. It appears the ascent rate is about 330 ft/min. Is that the expected rate?

The data from KB0TVJ-11 is intermittent - there are periodic transmissions reported on findu, but sometimes the GPS data is a repeat. Almost as if there is an intermittent connection to the GPS on a KPC-3 - I don't know what the tracker configuration is.

Is the balloon expected to float at a certain altitude? Given today's sounding and a short-range forecast, I'm trying to figure out if it will come back over land any time soon.

73 de Mark N9XTN

Hi Mark

Sending you some "up closer and personal" data from my station.
You can compare it against Findu data.

Gotta get ready for Field Day tomorrow,this flight should make
it more interesting.

Mark Conner wrote:

3126. Re: [tvnsp] GAINS flight ascent rate

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-22 01:43:53 UTC
From: Craig Brunson
Topic: 3120 Message: 3126

Russ had a problem with his GPS for a while, but it started working ok.
Some of the web sites are working too:
http://www3.findu.com/cgi-bin/track.cgi?call=kb0tvj-11 has it approaching Mt Hood @ ~54k ft.

We launched through an inversion that held it at ~2000 ft for almost an hour. It was to float at ~54k, but went to over 57k, then porpoised & is just starting to sink a little. I am tracking the gov freq here in Hillsboro with my home system. I picked up the up/down video from it ~ 50 mi away.

More later -it's been a long day, up at 2:30 then the ride to Tillamook for the launch. I have a roll of film of the launch that I will have processed tonight or tomorrow.

3127. Friday's balloon launch from Tillamook

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-22 22:25:23 UTC
From: Craig Brunson
Topic: 3127 Message: 3127
Attachments: 7 described; binary payloads are missing from this source WARC

Hi all-

Here is a few shots of the balloon as it came out of the hangar, was moved upwind, & launched by two people.
It was a slow accent up & I always have a good view from the telemetry van.
These are low res scans to save bandwidth.

Mark,

Is there going to be an internet portal set up for the GPSL extraveganza? This is a question on behalf of Paul, he does not have access to email right now, and we noticed it won't be run on the standard APRS frequency either. Thanks!

Mike KC7DPD

Jeff-

They brought it down late last night. There seemed to be an excessive loss
of lift after dark & it was decided to bring it down then.
I haven't heard of how successful the rest of the flight went.

Date: 2002-06-23 01:36:26 UTC
From: Jeff Melanson
Topic: 3122 Message: 3131

Craig,

In the graph that Mark made there is a knee where the ascent
rate slowed from about 450 ft/min to 350 ft/min. This
happened around 40,000 ft. We usually see this knee at lower
altitudes. Do you know the cause of the slowing ascent rate?
Was this a controlled event or something to do with the
atmosphere?

3132. Re: [tvnsp] GAINS flight altitude graph

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-23 02:21:41 UTC
From: Craig Brunson
Topic: 3122 Message: 3132

I just looked at the graph Mark sent. I'm not sure, but as a guess, I would say that is when it hit near the jet stream, or higher winds, & went more horizontal. The mass of this balloon was great, & the winds would deflect the up angle, thus slowing the vertical accent. I wasn't paying attention to the accent rate at the time & would have to look over my data to see. Also, we were not doing any controlling on this flight of venting. The lower valve was open & the extra 'air' between the bladders was being exhaled as it ascended.

I may ask the experts next week when I get back at work.

Just forming an hypothesis here, ...

After sunset, doesn't the air cool? Isn't cool air denser than warm
air? Would this change in air density account for the change in vertical
velocity? Not only would it increase the drag on a falling object, but
wouldn't a given balloon configuration produce more lift in denser air,
even if it were negative "lift"?

Hmmm, ... an increase in descent rate. Is this due to falling
air? Doesn't denser, cooler air sink?
Maybe the balloon is riding in a descending air mass.

3138. Garmin GPS35 LVS - For Sale

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-24 00:06:42 UTC
From: Stephanie Steele
Topic: 3138 Message: 3138

Hi everyone,

I still have 5 of these units that are not spoken for. If anyone wants one please let me know right away as I expect them to arrive early this week. These are LVS units only!

I still do not know if I will have any extra HVS units so PLEASE don't write asking for an HVS unit. I have many more buyers than I have units so only those who have already written have any realistic chance of getting an HVS unit. If by any chance any are left I will post to the list and let you know.

Also, anyone who placed an order for either unit who has not yet sent payment, please do so immediately as I intend to release unpaid units to the waiting list as soon as the paid units ship.

3139. SpaceData balloons

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-25 18:19:44 UTC
From: Mark Conner
Topic: 3139 Message: 3139

Below is what I received answering a question I posed to SpaceData regarding how they plan to get extended temporal coverage for their wireless service on weather balloons.

It would be interesting if the amateur radio balloon community could come up with a lightweight, reliable, electrically-controlled valve assembly for latex balloons.

http://www.spacedata.net

73 de Mark N9XTN

=========

Yes we vent the balloons based on GPS and have patents pending that protect this technology. This extends the time to over 24 hours of float. We have done over 50 flights to date at altitudes up to 126,000 feet.

Mark, nice going that you got even a short answer. I
started thinking about this again after Spacedata came up on
the KNSP list and seeing the nice sunrise picture from very
high altitude. I do wish he'd said a few words about the
balloon envelopes.

I smell dotcom on this SpaceData enterprise (ie, eventual
bankruptcy or dissolution of business), so maybe we hams
can get some of the equipment at very reasonable prices. :)
It should be noted that I was pretty sure cellphones
would never survive economically either.

> It would be interesting if the amateur radio balloon
> community could come up with a lightweight, reliable,
> electrically-controlled valve assembly for latex balloons.

Yeah, before I read your message and just based on seeing
the winning bid for the spectrum and seeing the sunrise, it
seemed reasonable to presume that they've flown reliably
to altitude to be able to get venture money. Your message
now confirms that theory.

One of the many things I can't see flying is the idea of such
complex and expensive expendable payloads. Is there THAT
much money in rural supplementary cell phone coverage?
The main trick is not the technology, but being able to make it
all pay and be operational on some sort of reliable basis.

I think these SpaceData guys must be able to sell ice to the
Eskimos. Might be worth paying them to be part time amateur
radio lobbyists.

Hank

The figure I saw was $300 per payload, certainly not expensive enough to make recovery cost-effective. Still not sure on how they'd recover costs, but a lot of that mystifies me. If they get NWS to launch them, that's about $30k-$60k per day.

I smell some venture capital burning....

From: John Knapp
Topic: 3139 Message: 3142

I am still getting approval to use the facilities here at MicronPC for a meeting place. So far everything is looking good. The only catch is I will need to have a list of people who will be here for a meeting. This is a security requirement.

I am looking to have the first meeting Saturday, July 13 at 2:00pm. I can't make the July 6th date for personel reasons, also the plant will be shutdown for the July 4th Holiday and weekend (ei, a four day weekend).

If you want to meet on July 6 then contact Stephanie (hope this is okay) to see if she can arrange a meeting in Fruitland.

If you can make the July 13th meeting please let me know by Wednesday, July 10.

Thanks

3145. Meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-02-27 19:42:52 UTC
From: Stephanie Steele
Topic: 23 Message: 3145

Hello Jeff & Group,

I got Mike's message that Micron was out. I have announced the cancellation of this Sunday's meeting. Please refresh my memory when you wanted me to schedule the next meeting. Was it for the 6th or the 13th? Did we decide to come to Fruitland (for the Internet Connection) or were we staying over in your area? I should hear later today on the Fruitland training room but I do not expect any problem. Norma and I recall that Mike was not available on the 6th because of family and John was on call so he can't make a meeting in Fruitland. Do we just go for the 13th for a training meeting? Do we have a trainer for the 13th? Can John the younger do his Balloon Magic stuff then? Help!

Stephanie the confused

This meeting is cancelled due to multiple scheduling problems. We will meet next on either July 6th or 13th (See other message). John the younger, can you do your Balloon Track Training on the 13th in Fruitland?

Everyone please weigh in so we can get this scheduled please.

3147. Re: [tvnsp] Scheduled Meeting - June 30

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-06-28 02:15:21 UTC
From: Jeff melanson
Topic: 3147 Message: 3147

TVNSP,

The June 30th meeting is the one that is cancelled. At our last meeting
we decided that future meetings would no longer include construction
projects as this was not a very efficient use of time. Future meetings
will focus on the business end of things and on training. Those of us
working on projects can meet as needed at other times and places. This
format allows us to meet in more centrally located places like Nampa.
As soon as we get a date and a place and a training subject worked out
for the next meeting I will announce it here.

Will you find yourself in Boise any time this weekend for the River Festival ? If so, I could probably get my GPS 35 from you then. I've been asked to be in charge of the county comm. van, so I should be available just about any time.

Tim

3153. In Kansas

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-01 15:03:15 UTC
From: pverhage1960
Topic: 3153 Message: 3153

I'm here in wonderful, humid, Kansas. I made a stop at Strato Bowl while in the Black Hills. Strato Bowl is where they launched to Army captains on a high altitude balloon flight, the highest at the time. They were the first humans to see the curvature of the Earth.

To control and launch the balloon, they used lanyards that passed through eyebolts mounted to the top of the balloon.

Paul

3154. Training Schedule

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-01 23:45:16 UTC
From: Jeff Melanson
Topic: 3154 Message: 3154

TVNSP,

Since this weekend is a holiday weekend I'll assume most of us have commitments and I won't schedule a meeting. Since our meetings are mainly business and training we need to establish a meeting schedule that works for our group. I would like to have a meeting Friday night on July 12th 6:30 pm at Jade Garden. This meeting will be to establish who is teaching what and on what date. We will also discuss our progress for the August flight. I will also bring my small capsule for show and tell which should be completed before this meeting. Please plan on attending so that everyone gets an input to the schedule. Also think about what you might like to teach.

At the last meeting we decided...
Paul will continue the BASIC stamp training.
John the elder will do Balloon track and Flight predictions.
Jeff (me) will demonstrate the Liftwin program the Hank Riley wrote.

Here are some additional suggestions...
(I think some people volunteered but I won't put your name down until you let me know for sure.

Launch Procedures

All about APRS and using APRS+ software

Using Street Atlas with balloon track and APRS+

KCP3+, TinyTrack II, MIM module

Fox hunting and equipment

Global Positioning System overview and equipment specifics such and GPS35.

These lessons can be broken up or combined or have two instructors or whatever is needed. I'm sure there are more ideas for other lessons. Ideally you should have handouts and a training outline.

If Friday night doesn't work for you please let me know.

Jeff

3155. Herington airport (HRU) possible launch site

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-02 02:22:34 UTC
From: Mark Conner
Topic: 3155 Message: 3155

For those of you not on the GPSL list, you may not have heard we might end up using the Herington Municipal Airport (HRU) as our launch site. The forecast tracks are to the north or NNW at 10-15 miles, which makes the Johnson Near Space Center south of Manhattan unusable. We've gotten permission to use the airport for the launch, but we haven't yet decided to change the site. I'm not sure when that decision will be made - probably not until Thursday or Friday.

The airport is about 7 miles ENE of Herington. Below are some links that show where the airport is.

http://www.mapblast.com/myblast/map.mb?CT=38.7018%3A-96.815%3A20000&myzoom.x=144&myzoom.y=13
http://www.airnav.com/airport/HRU
http://terraserver.homeadvisor.msn.com/image.asp?S=13&T=1&X=431&Y=2678&Z=14&W=1

To get there, take I-70 to the US77 exit near Junction City, then go south 23 miles to US56 on the east side of Herington. Go east 6 miles to 2600 Road, then north 3 miles. At that point, you'll have to look for vehicles or get on the radio.

Approx. GPS coordinates: N38? 41.76' W96? 48.77'

John the Elder was to do the training. I will be out
of town on the 13th (vacation) so will not be able to
make that date also. Someone else may have to plug in
for me or we wait until later in July - maybe when
Paul is back.

I am really sorry about the confusion I caused about
meeting here at MicronPC but I found out it is against
company policy to allow outside groups to meet here.
It has to be work related.

Let me know where and when we will meet. If I can, I
will be there, the last two weekends in July are clear
at the present time. If we delay training on Balloon
Predictions until then I will give the training.

This article was sent to you by someone who found it on SF Gate.
The original article can be found on SFGate.com here:
http://www.sfgate.com/cgi-bin/article.cgi?file=/c/a/2002/07/03/BA150175.DTL

Wednesday, July 3, 2002 (SF Chronicle)
Up, up and away/A man and his lawn chair take flight
Steve Rubenstein, Chronicle Staff Writer

San Francisco -- Something important was proved Tuesday in San Francisco when a young man strapped himself into a lawn chair tied to a strand of flimsy balloons and floated 50 feet above Potrero Hill.
It was not a stunt, said the man in the chair. It was a scientific experiment.
No one knew exactly what was proved, however. Perhaps it was that latex can burst under pressure, a concept already well known in San Francisco.
The idea, if there was one, was to recreate the 1982 flight of "Lawn Chair Larry" Walters, the Los Angeles truck driver who flew a similar rig 16,000
feet into the sky above Southern California and lived to tell about it. An Australian TV company had commissioned the joyride for an upcoming special
on urban legends.
"Nothing can go wrong," said stuntman Adam Savage, preparing to go aloft, while a large number of things that could not go wrong kept going wrong.
The latex balloons, purchased for $10 apiece from a surplus store, had an unsettling knack of bursting during inflation. At least six of them popped
before Savage had even taken his place in the chair.
Then the balloons turned out to need twice as much helium to fill as Savage originally calculated, and extra gas cylinders had to be scrounged.
Then, with only minutes before lift-off, the batteries on the emergency walkie-talkies went out.
"I need some triple-A batteries!" the balloonist yelled.
"Somebody go check the deli! Maybe they have some!"

Meanwhile, more balloons popped.
"It's not making me nervous," Savage said, nervously, as the latex shards drifted to earth. "I suppose these balloons have outlived their shelf
life. That's why they were only $10 each."
After a quick review of the flight plan with the TV producer ("You go up, then you come down"), Savage climbed into the lawn chair ($29 from Sears),
strapped on his safety harness (borrowed from a Mission District climbing gym) and gazed up at his towering string of balloons, which resembled a
strand of giant Vidalia onions glistening in the morning sun.
Shortly before 9 a.m., helpers began removing sandbags and releasing their hold on three ropes tethering the chair to parked cars. Savage, not quite sure how to control the proceedings, began to rise slowly into the sky and drift gently over Missouri Street, like the Wizard of Oz making his
getaway.
The TV crew said Savage had soared to a height of 100 feet, but less partial observers placed the altitude at about half that. The walkie-talkie failure was never a factor, as air-to-ground communication was conducted largely by shouting.
The greatest humiliation occurred midway into the flight, when Savage downed a beer and, after warning observers below to stand clear, dropped the bottle over the side. The bottle failed to break on impact, clearly indicating to all the
less-than-life-threatening height of Savage's lawn chair.
"Better have another beer!" someone yelled.
Meanwhile, a modest crowd of gawkers gathered on Missouri Street to take in the spectacle, such as it was. Dogs barked, drivers honked and
passers-by giggled.
After 12 minutes aloft, the TV cameraman had recorded sufficient footage, and there was no good reason for the flight to continue. One by one,
Savage fired a BB gun at the balloons and the chair descended, as Sir Isaac predicted it would.
Back on the ground, Savage reached for a celebratory cigar and basked in what accolades there were. He said it had been eerie to ride his lawn
chair on the same day that balloonist Steve Fosset completed his round-the-world solo flight, although that comparison seemed more of a
stretch than anything that happened to the latex.
"I'm just glad it turned out OK," said Ed Wallace, manager of the electrical warehouse next door whose airspace Savage had drifted into. "It
didn't make any sense at all. He said he had the whole thing worked out perfectly, but it didn't look that way. The potential for him getting hurt

was pretty good."

3158. Herington airport (HRU) will be GPSL launch site

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-04 03:49:38 UTC
From: Mark Conner
Topic: 3158 Message: 3158

We have definitely decided on Herington for the launch site. The helium is already there and the winds look good for Saturday, with the landing expected about 10-12 miles N of the site.

Subject: [KNSP] Herington airport (HRU) possible launch site

For those of you not on the GPSL list, you may not have heard we might end up using the Herington Municipal Airport (HRU) as our launch site. The forecast tracks are to the north or NNW at 10-15 miles, which makes the Johnson Near Space Center south of Manhattan unusable. We've gotten permission to use the airport for the launch, but we haven't yet decided to change the site. I'm not sure when that decision will be made - probably not until Thursday or Friday.

The airport is about 7 miles ENE of Herington. Below are some links that show where the airport is.

http://www.mapblast.com/myblast/map.mb?CT=38.7018%3A-96.815%3A20000&myzoom.x=144&myzoom.y=13
http://www.airnav.com/airport/HRU
http://terraserver.homeadvisor.msn.com/image.asp?S=13&T=1&X=431&Y=2678&Z=14&W=1

To get there, take I-70 to the US77 exit near Junction City, then go south 23 miles to US56 on the east side of Herington. Go east 6 miles to 2600 Road, then north 3 miles. At that point, you'll have to look for vehicles or get on the radio.

Approx. GPS coordinates: N38° 41.76' W96° 48.77'

John,

The weekend of the 27th sounds good for the flight prediction training. At the next meeting we will decide how to break up or combine the different training subjects to get the most out of them. I would like to see us be very thorough even if the lessons take more than one meeting. I believe you said you wanted us to have internet access for this lesson in which case we'll check with Stephanie on when she can schedule the conference room at Fruitland City Hall.

TVNSP,

I need more feedback from the group for meeting schedules. I know Mike can't do Sundays for the rest of this summer. I would like to have a standard meeting time that works for as many of us as possible. The reason I was thinking of Fridays is to leave Saturday's open for other activities like balloon launches or people going hunting or camping. I realize we'll need to be flexible with the meeting times but it's easier for most people if we have a standard meeting time and place.

John has asked if we can meet earlier in the week because he can't come to the Friday evening meeting on the 12th. Will Thursday the 11th 6:30 pm at Jade Garden work for this meeting? Please post your feedback to all of this.

Hi Group,

Neither the 11th or 27th won't work for me as I work those days. I'd be happy to check on the availability of the training room if you wish for either of those days.

Here are the Friday's I have open for the summer. 7/12, 8/16, 8/23, 8/30, 9/6.

Here are the Saturday's I have open for the summer. 7/6, 7/13, 7/20, 8/24, 8/31.

Here are the Sunday's I have open for the summer. 7/7, 7/14, 7/21, 7/18, 9/1.

I don't care what day we have the meetings. I agree that we need a standard meeting day/time, the location can change as needed. My scheduling problems are the same regardless of the day because of my rotating schedule so don't worry about me. I'll make them when I can.

I appreciate your efforts to try and make this work for everyone.

Stephanie

At 7:00 AM on Saturday, can someone record the proton count listed on the www.spaceweather.com site? The number is located at the upper left hand corner. I'd like to see if there's a corelation between that count and the cosmic ray flux that the mission records.

Thanks,
Paul
(in warm and humid Kansas)

verhap@... should get a copy of the space weather home
page sent each half hour of next Saturday. You can get the data from
your email. (It might be wise if someone else grabs the data too, I
won't be anywhere near my computer Saturday.)

If you want it sent to a different address, let me know as soon as
possible. I'll be heading to Bruneau late Friday afternoon.

Jeff
Dates you set are ok for me. Busy part of my summer is about over now.
I may miss one meeting during the Fall hunting season.

I can do the APRS and SA training.

Sorry for late post. Two birthdays,one anniversary, and a camping trip
all this week and still not done ;)

3166. Callsigns for GPSL

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-05 15:22:51 UTC
From: n1ltv
Topic: 3165 Message: 3166

This might help to find balloons on findu.com:

N9XTN-11 Mark NSTAR Nebraska
W5VSI-11 Mike M. EOSS Colorado
KD7LMO-11 Mike G. ANSR Arizona
W0WR Zack Traveler Kansas
KA0JLF Don Habitat Kansas
KD4STH-11 Paul TVNSP Idaho
WB8ELK-11 Bill Alabama

This came from Mark's GPSL fequency coordination
page at

http://members.cox.net/n9xtn/gpsl_2002_freq_coordination.htm

Things are changing on the fly and it's possible that one
or two of the above may not fly or may piggyback.

Actually if you check again you will see my callsign is and always was KA0JLF-11 for the primary balloon id. Just didn't want you to watch my house sitting in KS.

FYI, if HABITAT SkyLab decides to attempt an altitude record, we may add a second balloon array. The decision will be made at the launch site tomorrow morning. IF we do this, I'm not sure what it's id will be, possibly my wife's callsign N0XZB-11. I guess that is the least I can do, I send up her radio & equipment - might as well use her ID. ;-) (This is an inside joke among HABITAT SkyLab, that has been going for years - I have used her radio without her knowing - more than once?)

73 de Don
HABITAT SkyLab - like other groups HABITAT, is an acronym, so it is all caps.

I hope this message is read with the humor that is meant to be in it. ;-)

Sorry for that small but important typo. I guess it had
something to do with being next on the list after Zack
who isn't listed with a dash number.

3172. 6 for 6 on recoveries today

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-07 04:41:50 UTC
From: Mark Conner
Topic: 3172 Message: 3172

I'm on my second day of 2.5 hours of sleep, so this will be short.

All payloads were recovered. KD0FW's ATV transmitter was tracked down by DFing - took 2-3 hours after landing to locate it. All others were recovered shortly after landing without incident. Several of us saw 3 payloads touchdown (TVNSP, EOSS, NSTAR).

I think everything functioned very well. Don't know of any significant payload problems.

Having 5 APRS payloads on one frequency worked better than expected. Not that many collision problems, certainly not enough to interfere with tracking.

All in all, a very successful symposium and flights. Congrats to all who made it happen.

3174. GPSL 2002

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-07 14:25:31 UTC
From: pverhage1960
Topic: 481 Message: 3174

What a wonderful event. I plan to make proceedings available as soon as I get everyone's notes. We spent all day Friday presenting. In fact we were over an hour late for dinner. Saturday's launch took a bit longer than I hoped. At one point I began to worry about the winds picking up (after April 2001's launch). Mark was pretty certain we didn't have anything to worry about, and by golly, we didn't. I have to shanghi people into working for TVNSP. There was one teen who was just watching, so I called him over and put him to work also. He really enjoyed watching us, so it wasn't hard to get him to help us out. The first lanyard release was normal, but I asked Ralph Wallio to cut the second lanyard free, rather than let the loop pull through the ring. This worked very well, the liftoff was very smooth and without any hangups.

My capsule reached a peak altitude of 79,000 feet (I believe this is the highest of GPSL 2002). I have several pictures of the other balloons taken from my balloon. Of course, those other balloons are below mine. I believe this is the first picture taken of another balloon from above it (I have four other balloons in one of the pictures). I have a nice photograph of the Earth's horizon that is being made into an 18X24 inch poster. A lot of the ground shots are slightly washed out due to the haze in eastern Kansas.

GPSL 2003 is tentively scheduled for 5 July 2003. There will be no symposium that year, but there will be at least four competitions during the launch.

Mr. Potatohead (Idaho Airbourne Assault) was released on his mission at 75,000 feet. But due to an orientation error, the lower capsule covered his dramatic parachute drop intro Kansas.

I'm also planning to get GPSL 2002 patches made by Don's wife. Those will be made available to everyone instead of t-shirts.

Paul

I would be interested in these since, unfortunately, I didn't make the symposium.

> My capsule reached a peak altitude of 79,000 feet (I believe this is
> the highest of GPSL 2002).

Actually Paul, you slipped again I think - he did this at dinner last night a couple times, yours was more like 87 or 88 K ft. and several were over 80,000. My memory is a bit fuzzy too. I did a quick look at flight logs last night but they are only vague shadows now. I heard KD0FW saying, on the repeater this morning - strike that - afternoon, that he thinks his did a free fall, from 40,000 ft., his year. Been there done that (last year).

> I'm also planning to get GPSL 2002 patches made by Don's wife. Those
> will be made available to everyone instead of t-shirts.

Cris does some nice work, whether it is embroidery - kites or parachutes - etc. I wonder how many of her parachutes flew at GPSL this year? Mark did you or KD0FW fly one of her chutes?

She and I started making kites this last year. I'll put some photos of our NASA wings up. We combined two kits, one white - one red, so we have alternate colors of red/white. They look pretty neat. Be warned you need a ground anchor in strong winds. Not even my bulk is enough to keep me on my feet. Last year hers yanked both of us forward. "Wife sailing" is a new sport I have pretty well perfected in several media's - ocean waves and now Kansas winds. ;-)

73 all! GPSL was another GREAT Success!!! We are looking forward to what Paul has planned for next year!

Don

3176. GPSL 2002 "peak" altitudes in detail

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-07 18:34:16 UTC
From: Hank Riley
Topic: 3176 Message: 3176

meters feet

Paul 26796 87900 (87913)
Mike 26671 87500 (87503)
Don 26052 85500 (85472)
Mark* 24987 82000 (81978)
Zack 22167 72700 (72726)

*reported in feet and converted to meters

This is what I get from using the igated data of the highest *reported* altitudes. I've shown the feet converted from meters rounded to hundreds of feet to set an example of showing data to a reasonable degree of precision but no more (the down-to-the-foot figures are in parentheses for those who insist).

Paul and Mike are already within a remarkably close 400 feet of each other, and Paul's igated figures suggest that his peak was almost caught perfectly by the timing of the packet transmissions. Mike's figures don't indicate a favorable timing (although it can't be ruled out), so to my way of thinking Mike's balloon in actuality may have edged out Paul's by as much as several hundred feet.

I offer these comments just to illustrate there is a certain approximation involved in pegging a balloon's height without more frequent measurements of the balloon's altitude. With this in mind, I think it's best to consider it a tie between the first two in the list.

The important point is that balloon altitudes by consumer GPS with coarse reporting (every 60 or 30 seconds) are really only accurate to within a hundred feet at best, and likely err much as 500 feet in the direction of underestimating altitude (because of the too infrequent measurement cycle).

Both of us flew chutes Cris made - I lent Mike one of mine for the flight. Agree totally that she does a very nice job and I'm looking forward to seeing the patches.

Cris does some nice work, whether it is embroidery - kites or parachutes - etc. I wonder how many of her parachutes flew at GPSL this year? Mark did you or KD0FW fly one of her chutes?

3179. Meeting time is Friday the 12th at 6:30 pm.

TVNSP,

The next meeting is officially scheduled for Friday July
12th, 6:30 pm at Jade Garden. Please let me know if you are
coming so that I can give Jade Garden a head count.
Earlier it was asked if we could move the meeting to
Thursday but that resulted in other members not being able
to go and that is why I have to commit to Friday.

Just in case all of you people up there in Idaho have been wondering, Paul behaved himself very well at GPSL-2002. He acted the perfect gentleman, (his Mom was watching), and he did not have to have the bottle of Prozac fed to him on launch day. (he did get close though)

The flights were perfect as was the company, and I had the pleasure of spotting Paul's payloads first as they came in for their landing.

A good time was had by all, and more of you should make the trip next year to give Paul support. He needs all the help that he can muster. He just can't handle being outnumbered by the Texans, Kansans, and Nebraskans! Oh, not to mention the 7 other states that had reps there!

I was going to comment on the use of GPS to determine the altitude, but Hank pretty much covers it here. One thing I would strongly suggest is that anyone that wants to see just how much variation there is in their GPS receivers run something like VisualGPS or similar applications for an hour or so. Or just log the output and examine the altitude output. I've never really liked relying on GPS output for determining altitude, but at present that's probably as good a way as any other means for most of us where balloons are involved.

Zack,

Could you please mention how often that measurement
is stored, and/or if you trigger a measurement at the
onset of negative vertical velocity?

Just for the benefit of the list, Zack's 22204
meters is just a bit higher than the igated max
altitude, no doubt due to the timing error that
I mentioned that will always underestimate a
peak height.

Hank

Basically it waits for a sudden drop in the altitude (ignoring small drops due to variations in the GPS and false triggers on the ground). It normally polls every second, but it doesn't poll during the transmission cycle which is about 6-8 seconds out of every minute.

When it sees the drop, then it begins transmitting that information as part of the telemetry string so that we instantly have record of it on the ground.

To: Ballooning@yahoogroups.com
Subject: [Ballooning] GPSL - Great Plains Super Launch

On July 5th and 6th, 2002 I attended the GPSL - Great Plain Super Launch. The GPSL was a two day Amateur High Altitude Ballooning Symposium held on the campus of Kansas State University.

The first day consisted of a number of presentations from various balloon groups on their payload packages, tracking and recovery procedures, rocket/balloon projects, and meteorology. I was fortunate enough to give two presentations. One on ANSR - Arizona Near Space Research and the second on the NSRV - Near Space Research Vehicle. The event was a great way to learn about other balloon programs around the country and to meet many of the people face to face in an informal setting.

On the second day, we launched six (6) balloons and their payloads at the same time. It was an incredible sight to see that many balloon in flight. Within a few hours, all the tracking teams recovered the payloads. Unlike Arizona, Kansas is mostly flat and there are farm roads on a one mile grid for miles and miles in all directions.

It would be nice to have ANSR launch a flight at next years GPSL, so mark your calendars and prepare for a road trip. And yes, you can bring your fireworks and firecrackers to Kansas.

3196. Storing Data in Flash Chips

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-10 01:58:51 UTC
From: Tony Barrett
Topic: 3196 Message: 3196

Anyone in the group have any experience writing data to flash memory? I'm not talking about Compact Flash modules. I'm looking more at an application of using something like a BASIC Stamp to store some date in some flash chips.

Any assistance would be appreciated.

Best regards,

Tony

3197. NSTAR 02-D (GPSL 2002) Flight Summary

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-10 02:01:50 UTC
From: Mark Conner
Topic: 3197 Message: 3197

NSTAR Flight 02-D was one of six flights at the 2002 Great Plains Super Launch. Because of the forecast winds, the launch was moved from the Johnson Near Space Center about 8 miles southwest of Manhattan to the Herington Municipal Airport about 7 miles east of Herington.

The launch crews began arriving about 7am. A few of the local residents had come out to watch the launch, and some more came as the morning progressed. Skies were clear but hazy, with temps in the low 70s and quite humid. An occasional light breeze was out of the southeast.

We unloaded our equipment and began moving the helium tanks outside. Though we had permission to use the hangar, the ceiling and door were a little low and with the light winds it was quite suitable to launch outside. We spent a fair amount of time checking out payloads and began filling around 8:30am. Six groups flew on this morning - TVNSP, NSTAR, EOSS, Traveler, KD0FW, and HABITAT.

Mike KD0FW brought an old and rather unusual balloon. The balloon had a date code of 1980 and the latex was a very dark brown. However, it was still flexible and looked OK. There was a string running inside the balloon that was attached to the top and terminated in a plastic ring at the bottom.

A couple of minor problems soon cropped up. KD0FW's balloon took a decided turn for the worse. The balloon developed a bulge on one side and looked like an aneurysm ready to pop. Sometime a little after 9am the 22-year-old balloon gave out and with a snap released all its helium. Fortunately WB8ELK had his 1200g balloon that he couldn't use, so we were still able to fly his payload.

The other minor problem occurred while EOSS was filling. The hose came off the regulator and could not be reattached. With a combination of duct tape and another regulator assembly, they were also able to continue.

A little later, the wind began to pick up with some gusts to 10-15 knots. This spurred us to get moving a little faster and we walked the balloons into launch position around 9:30am. As our group winched our balloon out, I noticed that the shroud lines were not straight - the shroud ring needed turned around. I unhooked the payloads and got it sorted out after a few tense moments.

Finally, we were ready to go. Paul KD4STH did a "ready" call for all the groups and after a five-count, everyone let their payloads go at 9:42:30am CDT (+/- 5 sec). What a sight! All of the balloons drifted to the northwest as they rose into the hazy Kansas sky.

With a short chase expected, we had plenty of time to load our equipment. All the payloads were running fine and putting out good data. With 5 APRS

payloads on 144.34 MHz (KD0FW was tracked by DF only), it was a busy frequency! Three of the payloads were time slotted (EOSS, TVNSP, and NSTAR), while the other two (Traveler, HABITAT) were at intervals that would not consistently collide with the same payload. The sharing worked out well and we had plenty of data for tracking purposes.

Around 10:20am we left the launch site and headed towards Herington. We planned to stop at a gas station Street Atlas USA had promised us, but it had gone out of business. Fortunately there was a Dairy Queen next door and several stopped in for some snacks. We stayed at the Dairy Queen until about 10:50am, soon after Traveler had burst (the first of the day).

As we left Herington, it became apparent Traveler would be down well before the others, and that we could chase it to its landing and still have time to make the other landings. With the capsule reporting about once per minute, it was difficult to dead-reckon the reports into where to look. We chased north of Highway 4 on some gravel roads and pulled up parallel to Traveler's track about 1/2 mile to the west. To my knowledge, none of us saw it touch down at 11:11 am CDT.

Seeing that Traveler was in a relatively safe area with its own chase team going for the recovery, we then took a look at what else was happening. While we were chasing Traveler on its terminal descent, EOSS and TVNSP had b urst shortly before 11am. Both were coming down in close proximity to each other, with TVNSP about three minutes lower. We got back on Hwy 4 westbound and headed for Hope and then Elmo, KS. Enroute to Hope, we saw that NSTAR had burst at 11:25 at an altitude of 81,978 ft. With the light winds all from the SSE below about 30,000 ft, the end part of the chase was relatively easy. We turned north on Hwy 15 and began considering where to stop to see TVNSP land.

As we stopped on 15, TVNSP was crossing over the road and from the track looked as though it would land nearby. I got out of the car and was able to see TVNSP at about 1000 ft AGL. At times it appeared it would stop moving north, so I hopped the fence with my camera thinking maybe I could run a couple hundred yards and catch it. But then it took off to the north again and landed a few hundred yards away at 11:44am in what looked like a good area.

With the second payload on the ground, my attention turned to EOSS on nearly the same track. Since I had a good vantage point, I decided to stay in place and look for the EOSS payload. Sure enough, within a minute or two it was also visible and it landed a little farther away at 11:47am.

Now it was NSTAR's turn. Actually, it looked like it too would land not far away. Using the just-completed descents of the other two payloads, I surmised the landing would be west and a bit north of the EOSS landing. We went north to the next county road and then west a mile.

Suddenly, APRSPlus locked up on me with NSTAR still a couple of minutes from landing. I couldn't close the program and a bit later lost the OS. Great - a chance for another "catch" and I'm without data for the last few minutes.

Paul KC0KXR and Doug KA0O both had APRSPlus, so after some frantic running back and forth we made another adjustment for our vantage point.

We stopped on a gravel road on the next section boundary west of the EOSS and TVNSP landings and got out to look for the parachute. There it was! About 1000 feet up, off to our SSE and headed our way. The payload was descending in a spiral manner and I thought maybe it would come close enough to us to catch the power lines next to the road. But it stopped short and fell into a corn field about 100 yds east of the road at 12:02pm CDT.

We found the landowner and got permission to get the payload. Everything was intact and operating - the corn even kept the payloads from hitting the ground. After we got back, Mike W5VSI and Rick N0KKZ joined us. We took a few pictures and then got on the radio to find out where to go next.

Don KA0JLF's payload had also come down nearby, about 10 minutes before NSTAR did. We got a general description of where it was and drove off that direction. Shortly we got a packet of the landing position and parked on the road next to the field it landed in. Soon most everyone had arrived and Don went off in search of his payload, which was also found intact.

Now the only one left to deal with was Mike KD0FW's ATV and simplex repeater. EOSS, with its extensive DF experience was already on the job. As we moved back east, we tried to key up the simplex repeater on 147.585 in the hopes of having a stronger signal to DF. Others were listening on the ATV carrier frequency. Since there were plenty of vehicles in the hunt, those of us with vehicles capable of hauling helium tanks went back to the airport to move them closer to Manhattan and save some time for Paul on Monday.

After getting the tanks, we headed for Junction City to leave film at Wal-Mart and sat down to get something to drink. While waiting on the 1-hour photo job, we found out that Mike's package had been successfully located and everyone was arriving at Cracker Barrel for a mid-afternoon lunch.

As it turned out, we could have flown from JNSC if our payloads had followed the same profile. Traveler would have landed between Fort Riley and the Milford Reservoir, and the rest would have been a few miles west of the reservoir. But it still would not have been safe to do so.

3198. Garmin GPS-35 HVS Mod - Repost

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-10 02:12:45 UTC
From: Harry M
Topic: 3198 Message: 3198

FYI

Just thought I'd share my GPS Mod page!

I added an internal preamp to my Garmin GPS-35HVS TracPak. This is the HVS (12v) version.
It is still in the vehicle and working great.

Harry

Mike told me, and he told the KCATV group on the net Sunday night. Unfortunately that brain cell just sizzled. If Mike doesn't let us know before, I'll ask him at the KCATV group meeting tomorrow night.

I think it was a PC Electronics board. I remember he had a WB8ELK id'er (overlay?). There as another id'er that one of the club members built, worked on or something.

This guessing could go on and on - like me. I'll stop now and wait for Mike to reply or tomorrow night. If he doesn't respond I'll get the answer and let you know.

Did anyone record it?

One of the topics I plan to bring up at the KCATV meeting tomorrow night is my ATV capsule. I need to finish it up, put it in a capsule, I would like to test fly it on the next launch. That would be a good payload for the 300 gram balloon. My balloon payload (ATV xmitter) is set for the KCATV repeater input. I want to verify they are still okay with that. A relatively low altitude quick flight maybe the ideal test flight.

3203. Testing Results

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-10 22:18:41 UTC
From: Stephanie Steele
Topic: 3203 Message: 3203

Can someone please tell me which component's batteries failed first when the 'test to failure' was done. This was when the assembled capsule was driven to Bogus and back and then left to run until the equipment stopped reporting. Thanks!

3205. Windows CE 3.0 / Pocket PC Programmer Consultant

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-11 03:11:28 UTC
From: Tony Barrett
Topic: 3205 Message: 3205

Hey Fellow Hams,

I know of a Boise company trying to hire a consultant to do some programming on a Windows CE 3.0 machine that needs a few Pocket PC extensions. They are using the Hitachi SH3 processor.

Do you know anyone qualified that might be interested in picking up a few hours of consulting work at a pretty good rate?

If so, have them contact me at: tonybarrett@...

For those of you not in the Boise area, I'm pretty sure this is the kind of work that could be done remotely.

Thanks,

Tony

3206. High altitude pictures from the TVNSP capsule at GPSL

3209. Beacon

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-12 16:41:18 UTC
From: Harry M
Topic: 3209 Message: 3209

Since I've been back from GPSL I've generated a little interest in ballooning here.
I need a simple light weight CW ID beacon & 2m or 70cm xmtr. I do not have the resources to or the time to make one from scratch so I am looking for a kit or an assembled one. This will be used on a small low altitude balloon to get more people interested.

Thanks!

Harry

> This will be used on a small low altitude balloon to get
> more people interested.

Harry,

I can supply you with an 18 pin PIC programmed to do a
callsign and a few other messages that rotate on a fixed
time cycle.

It's not too hard to wire it up on a little Radio Shack
PC board.

I'd only need to modify the code I use to generate an audio
tone (if you expect to use an HT) because the way SkyQuest
payloads work is that they generate real CW and not CW on
FM, so no audio tone is needed

You might want to check out our SkyQuest system at

http://www.geocities.com/n1ltv/hablic.htm

We have always used small balloons (see pictures) and we're
quite fond of simple, relatively inexpensive ballooning.

On the subject of simple transmitters, clock oscillators,
despite their miniscule power, do an amazingly good job
with line of sight and being on true CW (keyed on and off).

If you could live with that (CW not too good on an FM HT),
then you can really do the whole thing cheap.

Hank

3211. Training and Workshop?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-15 19:45:47 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3211 Message: 3211

I'm passing this message on to the TVNSP and NHABG listservs.

TVNSP holds regular training meetings and workshops. Would
TVNSP be interested in doing one for NHABG in their neck of the
woods? Would NHABG be interested in having us visit?

I'm envisioning that TVNSP would give generalized training in the
morning on such things as filling procedures, predicting, tracking,
etc. After lunch we'd break into groups and work on things like
making a parachute, filling equipment, airframe, and electroncis.

It would be a crash course in everything needed to start launching
balloons. After the visit, NHABG would still spend several more
days completing construction. I think this would help NHABG get
their program off the ground, so to speak.

Any input? I'd like to do this during mid August. TVNSP will email
a list of materials you'll need. I'll donate some construction
materials. I'll also shoot some PCB's for the group to assemble
into a flight computer, beacon, sensors, and flight termination unit.
NHABG would have to locate a site to hold the workshop.

Paul

3212. Meetings?

I plan to rock hunt for opals at a mine in Nevada in the next week or two. Is nayone interested in going a long? There's a fee they charge, but it's reasonable and you do find precious opals there.

Also, in about three weeks, I plan to take my telescope to Murphy for the night (I'll camp over night). Is anyone interested in going a long? Part of the reason is that I don't think I can carry my reflector in my little Prizm.

I got a bill from Sheehan's for $133.92. It's for 2 helium tanks on 24 May. Didn't we have money inb the account for this? I'll talk to Sheehans once I know our side of the story.

The May flight was our second launch. As I recall, we hade money for two launches. Doug, I thought you dropped off money for the account.

Thanks for everyone's help in straightening this out.

Paul

When is the next NWAPRS conference? The Idaho Star Patry is
the first full wekend in September. I wonder if there's going to be a
conflict.

Paul

Cool. Have to wait and see what's happening over the next week, but if you remind me, I might try to tag along. I've just rigged a Celestron 8 with a web cam and have stacking software I'd like to try out. Remind me/us in a couple weeks about this?

Paul

The TVRA club had its meeting last week and will not have one now
until the second Thursday in September.(August has been cancelled so
memberes can participate in a local parade)

From: verhap@occ1.sd01.k12.id.us
Topic: 3235 Message: 3235

Is the next meeting this Friday?

Is anyone interested in going to Seattle on the 16-17th for a presentation?

I'll be presenting at ALCON on the 2nd in Salt Lake. Check out their website at:

http://www.alcon2002.org/

Paul

3236. August Flight?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-18 18:42:35 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3236 Message: 3236

We need to order a balloon for the August flight. Remember, this on is a high altitude attempt. The 3000 gram balloon costs $200. We'll only need two tanks of helium. Mike, do we have any helium left?

We'll need to split the cost of this flight and need to order a balloon asap.

What day are we going to launch? I'll be gone the 2nd of August, which is probably too soon to get a balloon. Would the 10th work? I hope to travel to Seattle on the 17th. The 24th should work for me, though.

What's everyone else's schedule like?

TVNSP,

I am ready to receive materials and/or ideas for the TVNSP website. If they are large files, over 5 MB, I would prefer them on CD, or if you have it, a ZIP-100 disk. I promise not to keep the ZIP disks if you use that method! :) My email address is kc7dpd@... I will be out of town for the next meeting on the 26th, but I will be at the one after that......

For Doug Rich, I still need the instructions on how to upload to the website. Thanks!

Mike KC7DPD

Paul,

There was discussion of pricing a larger balloon for this flight. Did anyone do so? I believe the discussed size was 5000 gram. Let's do this before we buy the 3000.

I would also suggest that TVNSP meets before any further commitments are made for the group.

JohnK,

If the wheels fall off for Jade Garden on the 26th, let me know asap so I can check on availability of the Fruitland location for that night. We have DSL available at that location. I will not be able to make the Jade Garden meeting as I am working and don't have enough time for the trip to Nampa.

This flight needs to be the 24th or 31st for me to participate. I want the group to meet and discuss the balloon size prior to purchasing anything. We need to decide what the goal of the launch is so we know which balloon to purchase.

TVNSP,

There are at least three things that should be on the
agenda.
1) Paul's presentation of GPSL.
2) John's Flight Prediction Class.
3) Proper planning of the August flight.

For the August flight we need to commit to a mission. If the
mission is to get the altitude record then the entire flight
should be geared for that. Let's not load on a bunch of
stuff and end up with to much weight. If we want a bunch of
payloads then let's not spend the money on the expensive
balloon. We need to settle on what the mission is, the
equipment to be carried, and have a timeline set up so that
we assemble and test the capsules with time to spare.

Think about these things and let's get it worked out at the
next meeting. If you can't come to the meeting and want your
thoughts represented post them here and I will make sure
it's on the agenda.

No. I am working a 15 hour shift Friday night, going home to get some sleep, then heading to Twin Falls to help with the MS 150 Bike Race on Sunday.

BTW, for those interested, they only have 3 volunteers to cover from Twin Falls to Glenn's Ferry on this event. I would encourage anyone who can to help Lee with this event. He and their group have been very generous with the APRS users in Idaho in allowing us placement of a digi on Mt. Harrison and it would be nice to give something back.

Hi John,

I'm looking at more information that Lee sent and it appears that the 'hole' stretches from MP 110 on the west end to MP 131 on the east end. There has to be somewhere in the King Hill area that will relay to either Mt. Harrison or Cinnabar from Glenns Ferry. The challenge will be locating that spot. The maps show many roads in the area so I have to believe that somewhere there will work. Ideally someone could set up high as a relay and someone else be at the start/finish line to send to the relay but there are just not enought bodies. I wish I had gotten earlier notice so I could have set something like a portable digi up and gotten it down there. :-(

3251. WinAPRS, PmapOCX, & Windows XP Pro

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-20 15:16:20 UTC
From: Tony Barrett
Topic: 3251 Message: 3251

Ladies and Gentlemen,

Some assistance please.

I am trying to get WinAPRS to run with Precision Mapping on a new machine that's using Windows XP Pro as the Operating System. From what I've read on the various SIGs, this can sometimes be problematic. I've tried a couple of suggestions (see notes below), but so far no luck.

I've tried using cmd.exe to run the pmapocx batch file, and I've tried the approach of making sure the files copied by pmapocx.bat are in the "correct" directory, through I'm not sure I know which directory that is.

Its very frustrating to spend a fortune on a new machine with the intent of using primarily for APRS, only to have everything work but the last line in the ocx file. I know I installed this very same software (same CDs) on a friend's XP machine a few weeks ago and we did not have any problems. Its still running on his machine, so there must be a way of making this work under XP.

Any more suggestions, hints, or tips out there?

73,

Tony - N7MTZ

I had the same problem until I realized that the pmapocx.bat has to be edited to point at the directory your OS is installed in.

The original pmapocx.bat:

```
>copy Regsvr32.exe c:\windows\system\Regsvr32.exe
>copy MAPOCX.OCX c:\windows\system\MAPOCX.OCX
>copy OC30.DLL c:\windows\system\OC30.DLL
>c:
>cd \windows\system
>Regsvr32 MAPOCX.OCX
```

The edited 2kocx.bat for MY system, yours will probably be different:

```
>copy Regsvr32.exe e:\winnt\system\Regsvr32.exe
>copy MAPOCX.OCX e:\winnt\system\MAPOCX.OCX
>copy OC30.DLL e:\winnt\system\OC30.DLL
>e:
>cd \winnt\system
>Regsvr32 MAPOCX.OCX
```

7 3
Earl

I had a problem getting PmapOCX.bat to run on my new WinXP laptop. Got an error every time I ran it from Windows Explorer or from <Start><Run> which always worked with Win98. In XP under Windows/System32 there is a program called "cmd.exe" which performs "Text-based (command line) functions". Ran PmapOCX.bat using "cmd.exe" and it installed perfectly. Anyway, this is for the "what its worth department."

Hi Tony,

Have you tried setting WinAPRS to run in Windows 98 compatibility mode?
This helps many older non-XP programs to deal with XP. Other than that
the only reason I can see that it runs on John's and not on yours is
some setting that Dell uses in their 'standardized' install routine for XP.

Which versions are you using? Have you upgraded to the Precision Maps 5.0
version?

I'm sure I've seen some issues discussed on the APRSSIG, but since I don't
run WinAPRS it doesn't look like I've saved them. Perhaps somebody else
that follows that SIG has.

Just going from memory I would think setting up at the top on one side or the other would cover a lot of it. I'll plug it into the topo map later and try to get a better read.

BTW if there is any interest I can talk about how to pull data from APRS+SA to TopoUSA at some point. It isn't automatic, but it's fairly straightforward. If anybody has TopoUSA and would like a copy of the Digi positions file I have just let me know.

>the relay but there are just not enought bodies. I wish I had gotten
>earlier notice so I could have set something like a portable digi up and
>gotten it down there. :-(

No doubt - we've got plenty of bodies with experience helping with the Women's challenge bike race and experience setting up portable digis in the field. (In my case I'm wishing I'd read this last night although it doesn't sound like there would have been time to coordinate anything. We just got back from a camping trip so jumping in the car doesn't sound too appealing...)

I know there are several of us interested in the balloon tracking class.
Personally I'm willing to make the drive to Fruitland if that makes it
easier for Stephanie to be there.

I had the pleasure of working with Stephanie and the
rest of the crew on the Bike race yesterday. Coverage
was good, we used both Simplex and Cinnabar repeater.
I think they also used the Harrison Repeater. The Bike
Race Sponsors were really appreciative of the help we
gave them. I would hope next year we have a little
more notice. I did some last minute scambling to be
able to help Sunday.

Thanks Stephanie for letting us have the oppurtunity
to help on this, glad you made it home safe and sound.

I was thrilled to have your help and provide the Idaho APRS users a token of appreciation to the Magic Valley group for their support of APRS in S Idaho. I know the Magic Valley group was very grateful as were the race promoters. The Magic Group was behind the curve on this for timely notification also and did all they could to muster last minute volunteers from their group and only turned to us as a last resort to try and present a credible presence of amateur radio in this event.

Your generous donation helped amateur radio save some face and I applaud you for the generous donation of your time. Amateur's often brag on their emergency preparedness for communications but when a last minute need arises they often fall short of the willingness to sacrifice a little of their time to make good on that claim. You showed that this is not always the case. Thanks!

A reminder that the next meeting is this Friday at the Jade Garden in Nampa. I believe it starts at 6:30. There appears to be a lot on the agenda so we need need to start on time. Apparently we will not have a internet connection so I will have some hand outs of varous screen shots. I will also have a CD there with the latest APRS, balloon track, and liftwin software on it. Since there is still a lot of space on the CD, is there any other software I can load up and distribute during the meeting?

I plan on going over the latest software versions, getting the balloon track information and using balloon track. Also the MRF information. I am not sure how to put the predicted information with balloon track, if someone that knows how to will contact me at jknapp@... I would appreciate it.

See everyone Friday night.

The error message will usually indicate that. I can find a sample if you want one. (I help run a large internet mail list so I see those kind of errors frequently. I also used to be a network admin.)

Give her time....

>Any suggestions for what SEP stands for?

Well, in the "Hitchhiker's Guide to the Galaxy" series they refer to that
as "somebody else's problem" but that doesn't seem to fit.

I'd like to see a text file (or something) with the appropriate URL's for getting the necessary data. I'd also like to see a sample dataset along with the predictions based on that data.

>--- Jeff Melanson <kd7inn@...> wrote:
> > 1) Paul's presentation of GPSL.

I'd suggest thinking of swapping 2 and 3 especially if it might make it possible for Stephanie to make it over. (or is the drive time problem on the other end?)

I'm eager to get 2 knocked out and looking forward to 1, but I think 3 is probably the most important to get done.

Bill

p.s. I'm midway through a permanent mobile installation. If I've got the right rig along I'll be glad to show my progress there. If I have enough time this week to get it done (iffy) I'll show the whole thing. Probably the biggest "different" thing is the GPS I used. I used a Smart Skymaster from Tri-M. It's got the best setup for permanent mounting that I've seen. It's a hockey puck sized GPS unit that mounts in a 3/4" hole and the wiring comes through the center of the mounting stud. Just got it mounted tonight.

3266. Re: [tvnsp] Agenda for the next meeting.

Yahoo group: tvnsp (2000 — 2002)

From: Stephanie Steele
Topic: 3246 Message: 3266

Hi Guys,

There is just no way practical for me to make a Nampa meeting on a work day. I am scheduled on shift at 9pm and I require 60-90 minutes to get myself and my equipment ready to go. When you add the 40-50 minute drive time from Nampa to Fruitland onto that you can see that I would have to leave the meeting right when it starts! In addition, this week, I have an all day court hearing on Friday after working all night Thursday night so finding some time to sleep for work Friday night is going to be a challenge. I'm very disappointed to miss the Flight Prediction Class but I'll just have to catch it some other time. Sorry to miss Paul's recap of GPSL too.

Now, onto August's flight. Here is my input. If we are going for a high altitude record then I would like to see us do it right. To have any reasonable chance at success (with any reasonably redundant tracking equipment & a camera), this would appear to require use of the next size up balloon from the 3000 gm (whatever size that is). I can't see putting the time, effort, and money into a half assed attempt. If we can't afford to do it right then let's just set some other goal and call it good.

BTW, if my capsule is to be scheduled on the August manifest, and if anyone wants to fly an experiment in it, please integrate your experiment onto a 10" high by 10.5" wide piece of the plasticized poster board material to allow it to fit into my modular capsule design. Because no video will fly in the capsule there is no limit to the thickness of your module board for this flight. If you want to fly something that will require some other type of mount please let me know. Also, if the decision is made not to fly my capsule that is fine too. As a reminder my capsule weighs right at 4 pounds flight ready (weighed with alkaline batteries installed) with no experiments on board. With a little tweaking I could probably get it down to 3 pounds 14 ounces but not much lower than that I suspect. There will also be some weight savings when I switch to lithium batteries for flight but I have not weighed it with lithiums so I can't say what the weight is. I am awaiting new battery holders before performing the final battery fitting and weight check.

From: Stephanie Steele
Topic: 3269 Message: 3274

Hmmm, this appears to seriously impact an August high altitude launch.
See how perceptive I am ;-)

Seriously, Kaymont's data has a 3000 gram balloon's maximum altitude as
124k. They post nozzle lift at 7.2 pounds but payload as 2.8 pounds. I
am confused! Can someone explain how to use this data?

Also, Kaysam's web site is down. I was trying to see what they had but
no go. Too late to call today as they are in NJ.

3275. Tonight's Meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-26 13:54:29 UTC
From: K7JPS - John
Topic: 3246 Message: 3275

Sorry, but I won't be able to make this meeting. My lame excuse is that this is my first opportunity to go camping this summer. I was looking forward to the class, as well as the report on GPSL 2002. I'll vote with Stephanie for a recap of these at another meeting.

As for the August flight, I'll leave it up to the group to decide what the manifest/mission should include. For the date, I vote for August 24, this looks like the one that most of us are available for. Also if we plan to launch at the Idaho Star Party in Bruneau, that is on Sept. 7 and we won't have much time to plan for it.

Usually I've gotten answer straight away. Typically a 1200 gram
balloon costs $50.

This shows how incidental sales of these very expensive balloons must be very, very low.

$40 per kilogram of balloon. Very rough, but it gives you an idea.

Maybe a phone call would be better.

Seems like Kaymont could be getting a "take it or leave it,"
independent, or "we don't need you small fries" attitude.

Or they're just flakey.

This is not a flip answer. You can't use that data and you
shouldn't try to.

You have to learn how to use a balloon inflation program!

Download LIFTWIN and read its short instructions!

http://www.geocities.com/n1ltv/hablic.htm

I've just finished an improved version prompted by the
creation of the TVNSP training session. John K. has it
and it has been web uploaded, but I'm not positive it
will work smoothly outside of its birthplace on my
computer (has to do with required files in the compile).

If it weren't for that I'd be announcing it all over the
place. It was finished a couple of hours ago.

My 600g's were $25.

However, I'm getting kind of fed up with Kaymont's customer service and my next balloons will be coming from Kaysam. I talked to a sales-lady there a few months back and she basically told me that they'd meet any of Kaymont's pricing.

These are all good ideas. Please do remember that all this
takes execution or implementation, i.e., somebody has to have
the chance to do it and then go do it! Easier said than done
to use the old adage.

I would have taken a shot at it, but I tried to explain a little
of the process to John in email as well as correcting the small
errors in LIFTWIN in time for the first training meeting.

Now that the new LIFTWIN seems to be in the can, I'll make up
some Heathkit style instructions about how to select and obtain
the forecast winds step by step, with plenty of screenshots.

3284. organization of TVNSP for basic decision making

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-27 01:22:25 UTC
From: n1ltv
Topic: 3284 Message: 3284

Just a few thoughts:

In light of the problems of just having a fair amount
of people at a meeting on any given day, maybe it might
be worth a try to have an executive board of sorts make
a few of the key planning decisions of TVNSP so that
constant changes and adjustments don't crop up quite
as often.

I'd like to go on record that I believe the training
sessions and similar efforts at getting a clearer,
more logical focus to TVNSP are steps in the right
direction and will pay off in the long run if you
stick with them.

Everyone doesn't have to do things the same way, but
it seems as if most of the balloon groups try to have
some basic schedule put together ahead of time,
delegate a variety of tasks that different people
can attend to, and try to get several things
accomplished at the same time because there are
so many details that do need to be done. Of course,
adjustments and changes sometimes need to be made, but
that doesn't mean you shouldn't try to have some
kind of schedule.

EOSS just announced it will not attempt a launch a *month*
from now at a huge (hot air) balloon festival outside Denver.
They are not waiting until later, it's been decided now and
that's that.

By making the decision now there will not be a lot of wasted
effort and discussion about who can do the launch and how it
will be done and where it will be done from.

Just because I'm curious what methods different groups use,
I'm going to ask how far in advance their balloons are
purchased.

Zack,

A very experienced big ballooning guy (university atmospheric science dept.) told me years ago that I didn't need to list Kaysam on the AMSAT balloon page because he said even his *university* was too small a fry to have Kaysam give it the time of day, much less small orders from us 'loonatics.

I guess things must have changed at Kaysam somehow.

What gave you the idea to inquire of Kaysam, the "customer is king"....NOT attitude at Kaymont?

Hank, I'm not quite sure I understand your question but basically, I was sick of having to call Kaymont three to four time to make sure an order got shipped (and still wondering after that). They never return your call, never send you emails..... heck, the one guy doesn't even know the pricing! If you don't talk directly to Paul, which is a rather difficult thing to do, then you've got 50/50 odds that anything is going to happen.

As for Kaysam, I don't remember the lady I talked to, but she was very polite and helpful. I'll try to make a note of any details once I order some balloons.

3288. Basic balloon lift terminology

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-27 06:26:28 UTC
From: n1ltv
Topic: 3269 Message: 3288

> Seriously, Kaymont's data has a 3000 gram balloon's
> maximum altitude as 124k. They post nozzle lift at 7.2 pounds
> but payload as 2.8 pounds. I am confused! Can someone explain
> how to use this data?

Lift of gas - weight of balloon = nozzle lift
Nozzle lift - payload weight = freelift

In the Kaymont example, freelift is 4.8 pounds. This net force
is what is required to have the balloon rise at a decent speed.
The bigger the balloon, the more freelift is required to
attain a certain ascent speed. That's because bigger balloons
have more aerodynamic drag.

If the freelift is zero, the balloon is "neutrally buoyant"
(neither rising nor falling).

If the freelift is negative, the balloon sinks to the ground.

Hank

3289. Balloon tables

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-27 06:33:08 UTC
From: n1ltv
Topic: 3289 Message: 3289

Stephanie,

Balloon tables of the type Kaymont publishes have very little use EXCEPT to provide values that can go *into* calculations to get the freelift and peak altitude and other useful numbers.

Those calculations are so involved they really need a computer to handle.

With a windows type user interface on your balloon program, you can investigate what happens with all kinds of combinations of balloon size, payload weight, and other factors.

When you all get used to LIFTWIN, this will all make perfect sense and you will be able to handle any situation and know exactly what to expect.

Hank

From: n1ltv
Topic: 3269 Message: 3296

> Ok, thanks. I did just that but LiftWin does not have the
> Kaymont 3000 gram balloon listed as an option. Now what?

Well, all righty then, looks like you need the new, improved,
LIFTWIN that gets your clothes even brighter ... and has the
Kaymont 3000.

John probably doled out a few copies on floppies Friday,
but it's easy enough to download:

http://www.geocities.com/n1ltv/newliftwin.htm

Just put liftw-03.exe in the same directory as your LW02
and you should be all set. They will peacefully coexist,
so you don't have to delete the old one.

> Does the Kaysam 3000 figure the same?

I forgot that was in there! It's probably quite similar,
and for rough planning, would be okay to substitute just to
run some ballpark numbers.

This stuff is inexact anyway, so you don't have to get too
concerned about high accuracy anyway because it isn't there.

Hank

3297. Re: [tvnsp] Friday meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-28 03:18:08 UTC
From: John Knapp
Topic: 3295 Message: 3297

I believe a good start was made. We covered a lot of ground, including Paul's talk about the GPSL super launch. It really looked interesting.

We are having a short launch next Saturday, with a max height of 50,000ft. We covered most of Balloon Track, some APRS information, and talked a little bit about LiftWin. The meeting lasted four hours, a little long, but was good. The launch will be late morning, about 10:00am. This will give us time to look at the mornings wind data. We will be meeting at some undetermined place Saturday morning at 9:00am.

As far as Balloon lift goes, we covered the use of the program, used text data from Friday morning for Boise, showed how to export the data so it can be used with Street Atlas, and several other items the program covers. Mainly how to use it.

It was a good meeting, a lot was accomplished.

Since I am getting long on this, I will list future launches:

Aug 3 - more of a practice launch
Sept 7 - In conjunction with an Astronomical group.
Oct 5 or 13.

I hope Paul or Jeff can give more details on this.

Again, Thanks for the help

3298. Re: [tvnsp] Friday meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-28 05:05:14 UTC
From: Jeff Melanson
Topic: 3295 Message: 3298

Hi all,

Paul did his GPSL presentation and it was very interesting. I asked him to make all this information available to Mike Garske our new webmaster so that it can be added to our website. Mike will be working to get the website updated. He's got a lot of work to do there!

John Knapp taught how to do flight predictions. This included the Balloon track software and where to get the information. He did a nice presentation with a projector hooked up to his laptop. A lot was covered in the time that we had. A second class will follow with more detail and how to use forecasted data.

We also discussed our training and flight schedules.

Aug. 3rd ...
Small capsule launch. This capsule is the small one I built and is ready to go. It has only an APRS tracker in it. For prediction purposes I used the new Liftwin version .3 that Hank updated for us and have the following numbers for you. The capsule weighs 2.3 pounds, the balloon is a 200 gm Kaymont, positive lift will be 2 pounds, ascent rate is 1000 fpm, descent rate is 1400 fpm, burst is 47,000 ft. The descent rate was obtained from the Spectrachutes website by estimating the 24" parachute performance for the 2.3 pound payload landing at an altitude of about 2500 ft.

Aug. 9th ...
Meeting 6:30 pm @ Jade Garden - Training on Liftwin and APRS+ software.

Aug. 23rd ...
Meeting 6:30 pm @ Jade Garden - Prelaunch meeting for Aug. 24th flight.

Aug. 24th ...
Stephanie's capsule flies for the first time. Her capsule will carry her tracker and Paul's APS camera. Paul's capsule will carry his tracker and geiger counter.

Sept. 6th ...
Paul's presentation to the Star Party at Bruneau Observatory. This would normally be a TVNSP meeting night. We may want to meet in Bruneau for our prelaunch meeting. Campground available for those who want to spend the night.

Sept. 7th ...
Bruneau Observatory launch. Although we will be setting up a tracking station here for the Star Party we won't necessarily be launching from here. It depends on the flight predictions. Launch time will be about 9:30 am. There will be three capsules. Paul's capsule will have his ATV ready to go. Stephanie's capsule will have her tracker, and my small capsule will have a tracker.

Sept. 20th ...
Meeting 6:30 pm @ Jade Garden. Training.

Oct. 4th ...
Prelaunch meeting. 6:30 pm @ Jade Garden.

Oct. 5th ...
This flight is to capture a sunrise on video and photographs. We will fly two capsules. Mine with the camcorder and tracker. Paul's with an APS camera, geiger counter, and tracker.

Additional information...
I intend to add my CW beacon to my capsule and make arrangements for a foxhunt with VOI and any other clubs or persons who want to participate. No date has been set yet. Paul's intends to build a capsule very similiar to mine and we may do a two balloon launch.
To bring everyone up to speed the capsule I'm referring to is one that I built with an insulated zippered lunch bag. It presently contains a GPS 35, an Alinco DJ-S11 radio, a Tiny Track II, two battery packs and a j-pole antenna. It weighs 2.3 pounds and has a 24" parachute. It is packed with foam rubber. The foam rubber is cut out to hold the equipment. I have drop tested it several times and found it can take heavy impacts with no problems. It's the one we are launching on Aug. 3rd. I've decided to name it the Arctic Zone since that's the name already on the lunch bag. When I add the CW beacon I will add a larger parachute.

I just talked to Paul at Kaymont. They are swamped with government orders, so they have not been able to take care of little customers like us. Paul was very apologetic about this.

They are out of 1200 gram balloons because of their government orders. Paul is sending me a 1500 gram balloon instead. He asked if I needed it this weekend and I said no, next week would be fine.

We'll see what happens.

Paul

Since we have a number of people giving lessons at TVNSP meetings, I'd like to suggest that after you make your presentation, write it up for publication in ATV Quarterly. Remember, Mr. Harlan pays for each published article. Can you think of a better reward for spending that time preparing to give your lesson?

Jeff, when things quiet down, put me down for alesson on lapse rates.

Subject: [tvnsp] Radio for prospective capsule

I was wondering if there is any other proven/worthy HT's other than the Alinco DJ-S11 that are light, cheap, and easily modified for use as an APRS transmitter in a capsule or is the Alinco a cheap, lightweight standard? Thanks

Justin, KD7PIT

3305. Flight Predictions.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-30 03:07:14 UTC
From: Jeff Melanson
Topic: 3305 Message: 3305

TVNSP,

I have done two flight predictions for the Aug. 3rd flight using forecasted data for Saturday. Yesterday the prediction showed that the capsule would travel 32 miles on a bearing of 43 degrees. Today the prediction comes up with 25 miles on a bearing of 48 degrees. The MRF shows that this should be a good ballpark prediction. It's time to look at the maps and start thinking about a safe landing area. So far I have only come up with the Bully Creek Campground launch site that puts the landing site near Weiser. The first prediction was 7 to 8 miles North of Weiser. Today's forecasted prediction is 3 to 4 miles West of Weiser. A launch from Homedale puts it near Emmett. A launch from Succor Creek puts it in Nampa. I'm not doing that again!

I'll write an explanation of how to do the forecasted prediction and post it tonight.

Flight predictions with forecast winds.

Click on this link:

http://gus.arlhq.noaa.gov/ready/cmet.html

Scroll down to

Forecast Soundings

It's on the left side of the screen. Just to the right of
this is a pull down menu that says

----Choose a Forecast Dataset----

Pull down the menu and select

Medium Range Forecast Model (MRF 191 km over Globe)

Type in our 3 letter ID which is boi or go to the bottom of
the page and enter in the Lat/Lon of the launch site. Click
on the Next button.

Near the top of the page select

Text listing only

Use the pull down menu to choose the time to plot. For our
upcoming launch choose

August 03, 2002 at 12 UTC (+___ Hrs)

Go to the bottom of the screen and click on Request Plot.

Cut and paste this entire page into Notepad and save the
file. Put this into Balloon Track just like we have always
done and there you have it!

Mark Conner says within 84 hours you can use the AVN model,
and within 48-60 hours you can use the Eta model.

Now you know how to do it so get crackin!

I haven't had a chance to put in different launch areas yet but this evening (using 6pm launch data - 2400Z) I had the following:

Bearing: 94.6 degrees
distance: 39.4 miles
Time: 67 Minutes.

The last MRF I looked at showed a general shift of the winds from the nw to the sw. I believe that would effect the launch and landing areas.

Anyone else have any thoughts on this?

3309. Re: [tvnsp] Flight Predictions with forecast winds.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-30 18:44:05 UTC
From: John Knapp
Topic: 3306 Message: 3309

Using this mornings data (for the forcasted data, not current data), and Bully Creek as the launch point, I got the following:

Landing at 44.2133 Degrees
-116.9622 Degrees
Bearing: 60 degrees
Distance: 25.5 miles
Time: 65 minutes.

Not sure where this puts the balloon (I don't have a map on this computer).

Jeff, what did you get for this?

Also, I believe I have figured out how to put in the landing site and find the launch point. In balloon track, go to the Calculators tab, then force site selector. That opens a new window, enter the landing site wanted, under force check 'landing site' and then calculate the data. I haven't spent a lot of time with it, hope someone will confirm what I found.

I dumped Jeff's original post on how to get forcast data
so i will mention here what i found.
Looks like you can get to the same site
by way of Balloon Track. Just go to the "Launch Browser" menu
and choose the "AVN Data" bar. Then just follow Jeff's
instructions. Saves remembering another book mark.

Randy,

This works when you are within 84 hours of launch time.
Outside 84 hours you need the MRF model instead of the AVN
model because the AVN model doesn't forecast out past 84
hours. Within 48 to 60 hours use the Eta model. If Mark
Conner is back from his honeymoon he can explain why. I
assume it's becuase these models are more accurate but I'm
not sure. You have to watch out for that assuming stuff.

The AVN model is updated more often. I suppose that's why
it's more accurate.

3315. Re: [tvnsp] Flight Predictions with forecast winds.

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-07-31 02:41:46 UTC
From: Jeff Melanson
Topic: 3306 Message: 3315

John,

My prediction using the MRF model is very close to yours.
That put's us about 3.5 miles SE of Weiser. Previous
predictions put us on the North or NW side.
Someone with knowledge of the Weiser area tell us about it.
Is it a good landing area? What are the hazards?

This must be fairly aggravating for you Jeff.

Please start using n1ltv@... until further
notice as I've mentioned before.

The format at yahoomail just changed 5 days ago
and I think they're tightening up on the quota overflow
criteria. Or, more accurately, they're increasing the
penalties at lower thresholds. I do not get informed
of this incoming mail getting cut off until it gets
real bad, so I'm not aware it's happening (in the early
stages where it's just barely overquota) until someone
tells me.

I'll try to be a substitute for Mark while he's
away. :)

The preferred models closer to launch may be
computed more often, but another perhaps more
important distinction is that they are based
on a finer "grid". That's a closer geographic
spacing.

Just for everybody's benefit, the elapsed time should not change at all no matter what the winds are. The fact that is does, sometimes by a significant amount, means that there is a tiny flaw in BalloonTrack.

I've meant to bring this up with Rick the program author. He reads the list so he'll see this message.

I first noticed the flaw on all the predictions Mark and I did for the last TVNSP launch (other than GPSL). I'm pretty sure it's related to the smaller number of forecast wind altitudes compared to a regular actual sounding. Compared to all the things BalloonTrack does perfectly, it's very minor.

Hank

3319. Re: [tvnsp] Re: Flight Predictions with forecast winds.

Actually, I've been back for a couple of days, but still mucking out my inbox.....

The AVN and MRF models are almost the same. The main difference is that the "MRF run" is only at 00Z and has a later data cutoff time. This allows for more data to initialize the model more accurately.

At present, the AVN is run by NCEP out to 384 hours 4x/day now. However, the ARL site that generates the soundings does not get all that data (I asked - it would overrun their current comm and disk space).

The Eta is preferred when its available due to its increased horizontal and vertical resolution. You'll get more details especially in the lower layers of the atmosphere, and the Eta will more accurately account for terrain influences (when your mountains are only represented by lumps at 190 km intervals, that doesn't help).

Hi Hank,

Here's another question.

There are two AVN models.

Aviation Model (AVN 191 km over Globe)

Aviatoin Model (AVN 111 km over N Hemisphere)

What's the difference?

I did a prediction this evening with a launch point
for Succor Creek. Predicted landing was close to
Highway 45, about halfway between Nampa and Murphy.
Details:

Lat: 43.4276
Long: -116.5798
Bearing: 60 degrees
Distance: 27 miles
Time: 66 minutes.

The Weiser area would present very few problems for your landing. There are very few water hazzards and the ground is mostly hay ground, cattle ranches, and easily accessible public lands (BLM & State). It's not as flat as the Payette River Valley area but just as problem free. Your only signifigant water hazzards are the Snake River which runs generally north/south at that point and the Weiser River which is very shallow and narrow this time of year. The Snake does make a short east/west run just west of Weiser. It is fairly shallow there with not much current this time of year but would still require a boat for recovery. I would still avoid a launch site which would result in that small area being the landing zone. Basically there are pretty long odds of landing in either of them as the balloon flight would run perpendicular with their direction for the most part.

If anyone is interested:

The Summer Gathering dates have been set:

September 6th, 7th, and 8th, 2002.

It will once again be hosted by the Proehl's (K7FZO et al) at Vallley Camp near North Bend.

This is a great opportunity for all APRS'ers (new and experienced) to get together and learn more about this aspect of amateur radio.

The gathering will likely follow the same formula as in the past years - Friday arrival, Saturday APRS presentations, Potluck Dinners, playing with computers and radios, and perhaps even a Saturday evening movie spectacular.

Overnight camping is available. Contact Thom Proehl directly for those arrangements.

Dave will update the web page with more details when he is available to do so. We just wanted to get the dates out now, so that you can start making plans to be there.

See you out there in September!

Brad N7JGX Lynnwood, WA.

Hi,

I looked into what was involved in our group doing a fund raiser at the Fruitland Family Fun Day and the only requirement is a $20 registration fee. I think this may conflict with the September launch in any case. Just thought I'd let you know. I suspect other similar events would have similar requirments.

Bruneau Dunes State Park will pay $100 for our presentation and launch. We need to arrange to set up equipment and to give the presentation. they have an LCD projector, so I'll begin writing up a PowerPoint presentation. We'll need to select videos and who is to give which part of the presentation.

The last one we did was at Labor Day. We barely broke even for whatever reason. We were at the rest stop just inside the Idaho border. If you want to do that type of money raising activity you need to sign up early in the year for a rest stop location. There are other options possible also. A lot of thought and commitment would need to go into this.

From: Stephanie Steele
Topic: 3325 Message: 3332

TVRA does one at this same rest stop and makes 3-500 each Thanksgiving.
The key to success is the weekend you pick. Tradionally, Memorial Day,
4th of July, and Thanksgiving are the best.

In past years we did fairly good. Last year was poor,
I don't think the club will do it again in the near
future. They are talking about setting up on Highway
55 just north of Horsehoe Bend this year sometime.

Since I wasn't at the last launch, could you tell me
how to get to Bully Creek, not just Lat/Long but where
is it?

This area is mostly open range so access should not be an issue. There is an abandoned railroad right of way and roads through the area. Might want a 4-wheeler along for quick access cross country where there are no roads.

2B is below, so if GPSL was 2C, Saturday's would be 2D.

Jeff, I hope you can get all the vital stuff people need
to get set for Saturday posted not too late on Friday to
the list.

A launch time and callsign are what I'm looking for, but
it's too late for HABLIC already.

Hank

Treasure Valley Near Space Project (TVNSP) will launch
flight TV02B.

Flight Specifications:

Launch date and time: Saturday, May 25, 2002 at 0630 MST (1230 UTC)
Launch site: Bully Creek Campground NW of Vale, OR N 44.03 W 117.41

3339. Re: [tvnsp] Pre-flight rendezvous

TVNSP,

The launch will be from Bully Creek Campground. Originally
we planned on meeting at someone's house to get the final
prediction with current data but that's not working out. I'm
changing the launch time from 10 am to 10:30 am so that I
have enough time to get the final prediction before driving
out. There is no prelaunch meeting.

Flight number is TV02D
Launch is 10:30 am
Launch site is Bully creek Campground
APRS is 144.39
Repeater is 147.27
Simplex is 146.52

Can someone post directions to Bully Creek Campground? John
Knapp has not been there before.

Hi John,

Get off in Ontario and go through Ontario on 20/26 to Vale. Go through Vale and as you exit town take the fork to the right which heads northwest. I believe it is marked for Bully Creek. Go out this highway several miles until you see the sign pointing to the right for Bully Creek. The road only goes right and will take you directly to the campground.

Hi Jeff & Group,

I totally spaced that this was not a 'crack-o-dawn' launch. If Randy is not available and you would like to stop by my place at 9am, I will stay up and meet with you then to get you the late data. Let me know if you need directions Jeff.

3347. TVNSP radio coverage prediction

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-02 17:47:05 UTC
From: Ralph Wallio, W0RPK
Topic: 3347 Message: 3347
Attachments: 1 described; binary payloads are missing from this source WARC

I am making progress using Radio Mobile to take topographic terrain into account while predicting HAB coverage (see http://www.cplus.org/rmw/english1.html for the very capable and free Radio Mobile software). The attached map is a coverage prediction for your next TVNSP flight while at 68kft above your Bully Creek launch site. The system can predict coverage from higher altitudes if it will help.

For you folks flying over mountains, it is interesting to see coverage shadows from terrain blockage and coverage at significant distances when using high mountain vantage points. For example, there is a shadow area northwest of Salt Lake City but good coverage of vantage points in the Uinta Mountains to the southeast. Another example is poor coverage near Seattle-Tacoma but good coverage of vantage points in the Olympic Mountains to the northwest.

These predictions might be exciting for distant stations attempting to set HAB telemetry and QSO distance records.

TNX es 73 de Ralph Wallio, W0RPK
wallio@...

It is all done by smoke and mirrors

3348. repost of TVNSP 02D flight characteristics

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-02 18:31:10 UTC
From: n1ltv
Topic: 3348 Message: 3348

The max altitude will be attained in under an hour.

Jeff is intentionally managing this flight to be a
shorter duration, lower altitude, shorter chase distance
flight.

The payload and balloon are small and light, making for an
easier, quicker launch process.

Should be a lot of fun. Best of luck and try not to worry
about it Jeff. Your preparation has been good.

Hank

[from Jeff's earlier message]

The capsule weighs 2.3 pounds, the balloon is a 200 gm
Kaymont, positive lift will be 2 pounds, ascent rate is 1000
fpm, descent rate is 1400 fpm, burst is 47,000 ft. The
descent rate was obtained from the Spectrachutes website by
estimating the 24" parachute performance for the 2.3 pound
payload landing at an altitude of about 2500 ft.

3349. Re: Flight number?

3351. [Fwd: Pre Launch Perdictions]

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-02 18:58:29 UTC
From: Jeff Melanson
Topic: 3351 Message: 3351

Hi Randy,

Meeting at your house would be great. Let's committ to the 8:30 to 9 am timeframe to meet there. We'll get the final predictions and then proceed to the launch site. The idea of this flight is to test our prediction skills using both Liftwin and Balloon Track. It would be nice to hear from everyone to make sure you know when and where we are meeting and to confirm who is coming.

Earlier I suggested using the 147.24 VOI repeater but perhaps TVRA's would be better.

Stephanie wrote:

> TVRA's repeaters that cover that area is 147.12 or 147.100

I don't know the coverages of these repeaters so someone who knows please let us know what is best for our flight path.

I hope you guys are practicing your predictions. I'll run a prediction a little later and post it. Let's compare results.

Jeff

Randy wrote:
-I replied to the group,Jeff and Stephanie,but it did not make it to Yahoo i guess. Did not have my work account set up with Yahoo. Working on it now. Only Jeff got the below reply. Jeff Sorry for late reply,i did not check my mail last night.
Too much garden this year taking my time.
I would be glad to have the group stop by and use my computer
for final wiind data. Would 8:30 or 9:00 ish be early enough. My wife will be getting
ready for work,so she will be kinda reluctant to have people

stomping around our small house while she is getting ready. I live at 1405 NW 17th st. or just look for my call on the map coming this way. 1 If you come in on the freeway, take the Payette exit and cross the bridge by Wal Mart.
2 Take the first Left after crossing the bridge.
3 Then take the very first left onto N17 th street.
4 I live in the second house from the corner on the right side of road.

5 There is large open lot in front of house for parking. I am only about 60 minutes (28 Miles) from Bully Creek from my house.
Following directions for those that have not been there fefore. 1 We go through Ontario OR and head for Vale,OR. from the Cairo Jct. intersection.
2 Go all the way through Vale and take Grahm Blvd. There is a sign that says "Bully Creek" and head straight west till you come to Bully Creek Rd.
3 Follow the Bully Creek Rd heading NW until you see the reservoir and take the first left
into the camping area.

3352. TV02D Help?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-02 19:02:20 UTC
From: bherrman@spro.net
Topic: 3352 Message: 3352

Any Boise area support needed for TV02D?

I'll be tied up in a PAL Soccer Coach meeting and won't be freed up till approximately 1430 local time, so I can't do anything that requires me around...

However, I could set up my home station to either be a backup I-Gate for Stephanie's -or- just to log data.

Good Luck on the launch - I'll look forward to hearing the results. I'm especially interested in how the small capsule
works.

Jeff

I just remembered,i only have Balloon Track 1.72 at home.
Cannot get the latest one (1.77) to work for some reason. Keeps asking
for a mapPointControl.ocx file for some reason. I have not had time
to ask for help from the author yet. Hope the 1.72 version is sufficient?

Funny it works fine here at work running Win 2000 professional but not
on my Win 95 machines. There is the .ocx file in the system folder on
2000,but not 95. Another reason to upgrade OS's i guess.

Rats, !#@!! more money required just to play with ham type toys ;-(

I do have Hank's latest Liftwin .03 loaded at home and Latptop.

regards

Hi Randy and Stephanie,

The plan is to meet at someone's house at 9 am if possible
to get the final flight prediction then proceed to the
launch site for a 10 am flight. It looks like it's
definitely going to be Bully Creek Campground for the
launch. The prediction puts the landing site 8 miles further
out than I wanted. If we change the free lift from 2 lbs to
3 lbs that changes the max altitude to 41,000 ft and brings
the landing point closer to Weiser. Do either of you want a
few people over for prelaunch predictions?

Jeff

3361. Posting predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-02 19:54:16 UTC
From: n1ltv
Topic: 3351 Message: 3361

> I hope you guys are practicing your predictions. I'll run a
> prediction a little later and post it. Let's compare
> results.

I just did one but I won't post it until I see the ones
from earlier this week so I know I've not made a big mistake.

A suggestion is that people should either agree on their
Balloontrack variables or post them together with each of
their predictions.

Here's what I used. The launch altitude is just a guess and
can be refined if someone gives me a better number. Not too
important anyway; affects the time aloft though.

BT version 1.71

Balloon variables: 1000 up 1400 down 47k peak

Site variables: Launch alt. 2500 feet Landing alt. 2500 feet

WX variables: ETA model Location BOI Time +15 UTC Saturday

Hank

From: Randy Farley
Topic: 3351 Message: 3362

The 147.120 or 147.100 TVRA repeaters do not work real well from Bully Creek for marginal radios until we get back on the road to Vale. The 147.240 works better, if i remember correctly. If neither work well while in the Bully Creek basin, we could use W7PAG's repeater (146.720- 100 Hz tone) on Cotton Wood Mtn, just NW of the launch site. We are welcome to try them all
and choose the best ones to fit our needs. Repeater chatter is pretty boring during the summer, so any balloon traffic we create would make for interesting listening for the armchair hams ;-)

Also my 4-wheeler with tracker is available if we need it for severe mountain or desert trail retrievals.

When you give your prediction results,please specify which data-set and time you use. I'm still not matching up to some of the earlier forecasts very well. I'm only in the right state so far (just kidding).
I think it is the times i get the data mostly.

Earlier I suggested using the 147.24 VOI repeater but
perhaps TVRA's would be better.

Stephanie wrote:

> TVRA's repeaters that cover that area is 147.12 or 147.100

I don't know the coverages of these repeaters so someone who
knows please let us know what is best for our flight path.

I hope you guys are practicing your predictions. I'll run a
prediction a little later and post it. Let's compare
results.

Jeff

Randy wrote:
-I replied to the group,Jeff and Stephanie,but it did not
make it to Yahoo i guess. Did not have my work account set
up with Yahoo. Working on it now. Only Jeff got the below
reply. Jeff Sorry for late reply,i did not check my mail
last night.
Too much garden this year taking my time.
I would be glad to have the group stop by and use my
computer
for final wiind data. Would 8:30 or 9:00 ish be early
enough. My wife will be getting
ready for work,so she will be kinda reluctant to have people

stomping around our small house while she is getting
ready. I live at 1405 NW 17th st. or just look for my call
on the map coming this way. 1 If you come in on the freeway,
take the Payette exit and cross the bridge by Wal Mart.
2 Take the first Left after crossing the bridge.
3 Then take the very first left onto N17 th street.
4 I live in the second house from the corner on the right
side of road.
5 There is large open lot in front of house for parking. I
am only about 60 minutes (28 Miles) from Bully Creek from my
house.
Following directions for those that have not been there
fefore. 1 We go through Ontario OR and head for Vale,OR.
from the Cairo Jct. intersection.
2 Go all the way through Vale and take Grahm Blvd. There is
a sign that says "Bully Creek" and head straight west till
you come to Bully Creek Rd.
3 Follow the Bully Creek Rd heading NW until you see the
reservoir and take the first left
into the camping area.

Hi Hank,

Bully Creek Campground is 3150 ft. I'm not sure what the
Weiser area landing site altitude is but I've been using
3000.

Hi Randy,

Stephanie indicated that a 4 wheeler would be a good idea.
It may make retreival easier depending on where it lands.
Part of the area has limited acces by roads. Let's plan on
it.

3365. ETA prediction for 02D

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-02 20:11:11 UTC
From: Hank Riley
Topic: 3365 Message: 3365

I'm getting 58 degrees, 41 miles. Midvale?

This is up considerably from earlier in the week if that's
right. Predictions 24-48 hours ahead are what count.

Try to think about what would happen if the balloon
went short or long. The predictions are rough estimates
EVEN for the day of launch winds!

Perish the thought, but think about what you'd do
if you had a signal but flaky or no GPS. If you have
DF stuff, bring it along. Better to have it and not
need it, then need it and not have it.

Same goes for good road, topo, or whatever other maps
you might have.

Hank

Sounds like it might take a few minutes to get out of
the campground area and on to the bigger roads leading
north.

This balloon will be down in about an hour, so is there
any thought to trying to have someone downwind at least
a little way to have a headstart? Maybe Weiser?

I know there are not throngs of people in the crew,
but just trying to think of possibilities before real
crunch time. The upper winds are a little stiff Saturday
so the balloon will be cranking at the higher altitudes.

Hank

3368. Re: [tvnsp] ETA prediction for 02D

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-02 20:38:34 UTC
From: Jeff Melanson
Topic: 3365 Message: 3368

I'm also getting 58 degrees, 41 miles. I used the Eta model
15 UTC.
The range started out at 28 miles earlier in the week and
has been moving out and now is 41 miles. I'm not all that
excited about the landing location but it is a safe area.
If we were to change the free lift from 2 lbs to 3 lbs that
would change the the burst altitude to 41,000 ft. This would
result in a prediction of 60 degrees, 32.5 miles. That is
West of Weiser about 6 miles and on the North side of Weiser
Rd about 1-1/2 miles. This is a good spot.
This would change the initial diameter of the 200 gram
balloon from 5.3 ft to 5.6 ft. This doesn't seem to be to
big of a change. Of course the balloon skin gets a little
thinner and careful handling is required (as always). Since
we haven't worked with this setup before it will be an
experience for all of us.

Thoughts on this?

Jeff

Hi Hank,

Yes. When we meet at Randy's house we will see who wants to
go ahead of the rest of the group. If fact if we can get a
picture of the capsule coming down on the parachute
Spectrachutes will give us a 5% discount on the next
purchase.

Jeff and crew,

I think your region is challenging, easier than parts of
New England, but very tricky. I wish I had knowledge
of your area including topography and road access.

In theory. :) You might be lucky to land within 8 miles
of the predicted spot. See R. Wallio data for reference on
this. Okay to be that specific if you're just giving the
predicted spot as the center of a circle which will contain
the actual landing spot.

My thought on this is to proceed with a high degree of caution
on increasing the inflation any more than you already have at
5 feet. This is an area (small balloon inflated that big)
where ham groups haven't much experience.

If conditions were totally or nearly calm at the campground,
or wherever you eventually end up, you might be able to decide
to go for it then.

However, if things are not calm or if the balloon looks real
tight at 5 feet or less, then you might think no way should
you go any further.

My guess would be that 2 pounds, 5 feet is enough for a margin
of safety until we know more about these high inflation,
lower altitude flights. I think my own 200 gram was inflated to
about 3 feet, so I can only imagine what 5 feet will look
like.

You'll know tomorrow. Hope plenty of cameras will be
present and clicking for this one!

Hank

Well, maybe not wrong but inconsistent with what Jeff
and I are doing.

Station: BOI
Descent: 1400
Landing altitude: 3000

Not sure if just changing those would pull your results
in. Your winds may not be for the same time as 1500 UTC.

From: n9xtn@cox.net
Topic: 3365 Message: 3378

NSTAR has launched two 350g balloons (one w/o payload, one with). Both were pretty highly inflated as they were intended to lift 10-11 lbs. No significant problems noted, but this was almost twice the balloon weight TVNSP is dealing with.

(the w/o payload flight was due to duct tape adhesive failure)

Shouldn't balloon thickness be inversely proportional to surface area (i.e., doubling the surface area should halve the thickness)? A 5-ft sphere has a surface area of 4*pi*(2.5^2) or about 79 ft^2. A 5.6-ft sphere is 98 ft^2. That's a 25% increase in surface area, or what should be a 25% decrease in thickness.

73 de Mark N9XTN

Mark and everyone,

An index to relative degree of inflation for any size balloon
with any payload is the burst height. Jeff's is already lower
than any amateur flight I know of, including I'm pretty sure
your NSTAR 350 g. Although ten pounds is a lot. Was that 10-11
of payload or nozzle lift?

> Shouldn't balloon thickness be inversely proportional to
> surface area

Yes.

> (i.e., doubling the surface area should halve
> the thickness)? A 5-ft sphere has a surface area of
> about 79 ft^2. A 5.6-ft sphere is 98 ft^2. That's a 25%
> increase in surface area, or what should be a 25% decrease
> in thickness.

Now the relation between "delicateness" or suceptibility to
burst maybe be more than inversely proportional to thickness.

Ferinstance, reducing skin thickness 25% at some absolute
thickness may increase the delicateness 70%. And I'm pretty
sure that's highly nonlinear (eventually) or else there would
not be a point where the balloon will stretch no more and has to
break no matter how gently it's handled or with no handling
actually.

I have broken many big weather balloons on the ground (with
air) and they get very touchy.

Hank

Group,

I take it we are meeting at Randy's house at 9am? I have read the
directions to Randy's house, shouldn't be too hard to find! I will be
listening to 147.240 in the morning.....with the helium onboard!
How many trackers do we have for the flight? I will have my gear there....

Mike KC7DPD

3388. second ETA prediction for 02D (+21 hours at 1500 UTC)

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-03 01:25:33 UTC
From: n1ltv
Topic: 3365 Message: 3388

BT version 1.71

Balloon variables: 1000 up 1400 down 47k peak

Site variables: Launch alt. 3150 feet Landing alt. 3000 feet

WX variables: ETA model +21 hours Location BOI
Time 1500 UTC Saturday

+21 hour run of ETA shows 55 miles, 39 degrees

(previous +27 hour run gave 58 degrees, 41 miles)

Hank

> I saw another message where the flight duration will only
> be about 1 hour. Is this correct?

Yup. About 44 minutes to burst, another 20 minutes to descend.

That's the prediction at least. :) The parachute descent
speed may be a bit off, and the burst altitude often causes
surprises, too.

That's what happened. I didn't realize until I read
your reaction, and I couldn't figure out what the big
deal was, and then it donned on me.

Jeff, ballooning with reusable, recoverable payloads
is nice. If this were a SkyQuest launch tomorrow I'd
be up half the night building and gluing and making
last minute changes to the payload. No way I'd be able
to be emailing like we all are.

Each SkyQuest launch means a whole new enclosure and
electronics! Cutting and gluing styrofoam is a real fun
thing .. not.

That's one of the reasons why it's been a while for
SkyQuest.

3396. campgrounds

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-03 02:29:16 UTC
From: n1ltv
Topic: 3393 Message: 3396

What's this Bully Creek place like and is it a state facility or federal (or other). A few pictures of that environment might be nice just for the record.

I notice on a Rand-McNally Road Atlas map there is a wayside or roadside park southwest of Midvale on 95. I guess that's nothing major.

It looks like the north-south road just to the east, 55, might serve some amount of recreation/tourism activity. Would I be on the right track with that thinking? Lots of fishing and hiking going on possibly with the nearby national forests and the River of No Return Wilderness Area?

Hank

3397. Forward: Several record possibilities for 02D

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-03 02:33:36 UTC
From: Hank Riley
Topic: 3397 Message: 3397

Record Keeping...

Hank suggested that we might be eligible for several categories of Ralph Wallio's Mission Records.

Looks like the possibilities are:

1) Lowest Reported Maximum Altitude (AGL)
2) Lightest payload
3) Touchdown Prediction Closest to Actual Coordinates
4) Highest Continuous Ascent Rate (averaged over >10,000ft)
5) Shortest Great Circle Distance, Release to Touchdown (at least 50kft maximum altitude ASL)

For the Touchdown prediction you must submit your prediction to Ralph before the launch. You do not have to be a TVNSP member to participate. Go to Ralph's website and read the requirements.

http://users.crosspaths.net/wallio/RECORDS.html

You might want to put your prediction in after we get the final prediction data at Randy's house. You are only allowed one submission. It could be a little difficult to predict it tonight since we might change the free lift amount. We'll decide that in the morning. I suspect we will if the balloon will cooperate.

Okay team, let's keep good records.

This is a BLM campground next to a reservoir with full RV facilities.
It has large (no time to check acreage)grassy campgrounds with 15+
year old russian olive and cottonwood trees for shade.This time of
year
it produces some of the finest blood sucking mosquitoes found in
nature.
Actually it is a man made water storage facility for local crop
irrigation.
The park and reservoir is surrounded by low rolling hills containing a
mixture of lava beds,sage brush,juniper trees,rattlesnakes,wild
mustangs and beutiful farm land sprinkled about here and yonder. There
are a lot of hot geo thermal and cold artesian springs in the area.
Will take pictures as time alows.

>

That is called the Midvale Hill rest area by locals. Nothing major,but
has
a nice view of the Cambridge and Council valleys to the north. Also a
historical Indian site where one could find lots of arrowheads. Even
though
it has a nice view of the surrounding valleys, it is a DFing
nightmare.
The surrounding canyaon and rocky outcrops produce some weird
multi-pathing signals.

Yes,that is one of our premier recreation sites for southern Idaho.
World class white water kayaking and rafting on the various forks of
the Payette rivers. The Salmon river area is too far north for

this balloon (knock on wood)flight. Those canyons are only good for
mountain sheep and rock climbers ;-) I hope we stay in the Weiser
river drainage area around highway 95 and not too far east. Those
mountains
have too many balloon hugging tree limbs for my comfort.

Oh.. the challenges of Idaho Ballooning.

3401. I really hope I did something wrong...

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-03 06:46:53 UTC
From: Bill Herrmann
Topic: 3398 Message: 3401

I finally got a chance to get stuff setup and run a prediction. (To add to the fun I got bounced off the list for a day or two early in the week.)

I used the 03/0000Z soundings from the University of Wyoming site and got a bearing of 61 degrees and range of 46.5 miles, which sounded similar to what I saw you guys predicting, so I didn't worry till I played with the export to Street Atlas function.

That flight path wound up landing right smack dab in the middle of Crane Creek reservoir, which didn't sound too desirable.

So, did I make a boo-boo somewhere or did the winds change enough to land it there? One oddity that I observed was that the printed flight synopsis showed a landing altitude of 1 foot. Plugged in 3000 there and I think it changed the landing spot slightly, but it still got wet.

Bill

p.s. Used 1000fpm ascent and 1400fpm descent launched at a 3150 foot altitude from 44.03N 117.41W. Got an elapsed time of 66 minutes. (Used burst altitude of 47000 feet.)

I'd suggest posting one prior to launch. Might be a good idea to do it about the time you meet at Randy's place. You could put the predicted launch & landing in there.

>Also, posting predicted landing spots on APRS was kinda nice
>too, any plans for trying that out again?

You'll have to see if somebody there can do it. I'm gonna be stuck in that meeting. Basically you just go in and send an object in APRS+SA. You can even set a course and speed for it. (though you probably don't want to in this case.)

Good luck!
Bill

Hi Bill,

The answer is that we are using forecast data tp predict the
future. We are currently using the Eta model for Aug 3, 2002
1500 UTC. We will get actual data this morning at Randy's
house when we meet there.

Bill and the group,

I got the same results when I did the Street Atlas export thing.....of course, we have to remember, those results will be 14 hours old at launch...I am sure mother nature will move the winds in another direction by then! :) We hope!
See ya'll in a couple hours!

3405. Morning Flight Predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-03 13:15:04 UTC
From: K7JPS - John
Topic: 3405 Message: 3405

I was able to pull this mornings data from the atmospheric soundings data site at Univ of WY. The data had 51 lines up to an alt. of 16540 m (54265').

I started with
Launch point N 44.0241 W 117.4008
Ascent 1000 fpm
Decent 1400 fpm
Alt 2520'
Burst 47000'

I predicted a landing of N 44.3775 W 116.7338
Alt. 3000
Time 64 min
Bearing 53.3
Range 41.1

This places it roughly 5 miles west of Crane Creek Reservoir. Looks like it might be a little bit of a hike.

3406. Re: [tvnsp] Morning Flight Predictions

Maybe the crew will decide to fatten up the balloon a little
to shorten the flight as already discussed here. That decision
may be made at the launch site so I guess we in the peanut
gallery will have to wait until it's over to find out what
was done.

Hank

3408. fast rising TVNSP 02D

Yahoo group: tvnsp (2000 — 2002)

From: n1ltv
Topic: 3408 Message: 3408

Appears to have a quite high vertical velocity
of about 1450 feet/minute.

I think Jeff wants no part of going too far north in
rugged, roadless terrain so it looks like he launched
a fat little balloon.

EOSS would call this a "hot" launch.

It will be interesting to see the burst height. It
may well be a bit less than the predicted 47k if
it has been overinflated relative to the prediction
as I suspect.

Hank

3409. 02D has burst and is on the way down

From: n1ltv
Topic: 3409 Message: 3409

highest 52503 feet around 11:28 MDT

For the sake of recovery, I'm glad it finally broke.

My prediction sent to Ralph Wallio this morning used a
burst height of 50k, and a parachute descent speed of
1500 ft/min.

The burst height was based on a 1000 ft/min rise,
which is not too close to what really happened.

It will be intersting to see what the parachute does.
For its size, the Balloontrack calc says way higher
than the 1400 feet that Spectrachute says and that
Jeff is trusting. I think BT says something around
1700 ft/min.

Attachments: 1 described; binary payloads are missing from this source WARC

This is in two scales for clarity. The landing was just
south of Midvale.

The 5k feet last APRS igated position was exactly at
the junction of Pole and Deep Creeks that flow into the
Weiser River. The actual landing is close enough to the
5k position that I skipped plotting it separately.

Note the big powerline just to the east!!!! Whoah.

I was talking to the group on simplex as they were out of repeater coverage.

The creeks are almost all dry, the river is barely a trickle. These are the joys of living in a desert. The railroad tracks are now gone. The desert is surrounded by forests that lumber companies can't touch thanks to federal land policies that have put them all out of business! Oh well, at least we still have a lot of trees to burn in forest fires ;-)

3419. Flight TV02D a success!

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-04 03:06:51 UTC
From: Jeff Melanson
Topic: 3419 Message: 3419

Hi all,

I know everyone wants all the details so here is some of it. Pictures will follow.

We filled the 200 gram balloon for a Nozzle Lift of 5.3 lbs to get a Free Lift of 3 lbs. That's about 5.5 feet in diameter according to Liftwin. We did this to try to bring the burst altitude down to 41,000 ft. The idea was to prevent the capsule from going to far past Weiser. There was some discussion about the balloon being to fragile but now we know from experience that is is not. We had no problems filling and handling the balloon at this diameter.
Launch time was 10:51 am. It was definitely a hot launch! We later calculated the ascent rate at 1350 fpm. Much faster than originally predicted (1150 fpm). I was surprised to see the altitude reach 52,539 ft! (As per my APRS log). That's a bit higher than that balloon was supposed to go! Paul and I calculated by hand how high the balloon should go and then ran the numbers with Liftwin and both methods showed 47,000 ft if filled for a free lift of 2 lbs. The change we made to 3 lbs should have been 41,000 ft. The balloon just did not perform as expected by Kaymont's data. Was this balloon different or is the Kaymont data wrong? Since we will be flying more of these in the future we will find out.
The closest we could drive to the landing site was .7 miles. I was surprised that we picked up the signal again. With a j-pole antenna laying on the ground in this rugged terrain and a 340 milliwatt radio it performed really well. We had to hike the rugged terrain around hills and through gully's and fences. It was said that the creek didn't have much water in it. That's true but it was a tough one to cross! At the first place we tried I worked my way through the bushes and approached the creek to discover a drop off of about 8 feet! We kept going further downstream (or was it upstream?) until we found a spot we could squeeze through. Watch those bushes, there sharp! Then up the hill. Only .7 miles? I wonder how far we actually hiked. We finally found it on the side of a hill down low. It was in good condition. We took GPS readings and pictures and drank water and rested. Then we had to make the hike back to the vehicles. Whew! More water please! We meet at Sizzler and refueled ourselves, then headed over to Randy's to look at the data and make copy's for everyone.
The 24 inch parachute form Spectrachutes performed as

expected. I predicted a descent rate of 1400 fpm. The actual rate was 1350. Yes it was the same as the ascent rate. This flight meets the criteria for five of Ralph Wallio's record categories and I will submit them to him a little later. The categories are:

1) Lowest Reported Maximum Altitude (AGL)
2) Highest Continuous Ascent Rate (averaged over >10,000ft)
3) Shortest Great Circle Distance, Release to Touchdown (at least 50kft maximum altitude ASL)
4) Lightest payload
5) Touchdown Prediction Closest to Actual Coordinates

Jeff or crew,

You've just done a first account, which was great, but I have
one question that I think is a basic one: How long after
touchdown did you arrive at roadside to go into the hills?

If you don't know try a guess.

Good enough for Spectrachute. They as much as said theirs
were different (better) than others.

I was watching this part of the flight with extra interest
because I'm going to add parachute drop to LIFTWIN. I guess
there might have to be two categories, SPECTRA and other.

Hank,

According to my APRS log the last data I recieved as it was coming down was at 11:52 am at an altitude of 3690 ft. I regained the signal at the roadside at 12:46 pm at an altitude of 2650 ft. That's 54 minutes for me. It was a little shorter for John and Deb because they arrived ahead of the rest of us.

It is sure neet to see how far the APRS I-Gate system has progressed
over the years. Now people everywhere can enjoy these events live.
Hank,glad to see your eagerness to watch us out West. Makes my
heart all warm and fuzzy knowing people around world may be watching.
Of course when we screw up, we hope all viewers receive voltage
spikes at their monitors ;-)

Jeff did a bang up job in preparation for this new type of flight
package. Just wished mother natures terrain was easier on him and the
crew.
I think we ought to enter one of them "extremist sports" TV
shows,maybe call it "Extremist Balloong". Whadya think Jeff ;-)

> Now people everywhere can enjoy these events live.

It is amazing. Just for everyone's info, those graphs
were done manually, not automagically (in the sense they're
not screenshots of any APRS site). I used a GARMIN CD
mapping program along with shareware Paintshop to neaten
up the graphics because the GARMIN map program will NOT
export graphics (very bad, very lame), so I had to do
screen shots and then trim, annotate, and combine into
one composite image.

> Hank,glad to see your eagerness to watch us out West

Oh, I'm a balloonatic for sure and this stuff to me is
the GREATEST, so thanks TVNSP. I really, really don't
understand why it hasn't caught on much bigger. To me
it's like soccer in the USA or cycling. Just can't figure
out why *everyone* (among hams I mean) isn't wild about
sending radio stuff up on balloons.

Heck, I'd like to try getting on a balloon and taking the
radio up myself! There is an outfit that is selling small
helium balloons to do tethered jumping in, and I saw a review
of these where the reviewer said he'd like to cut loose
and take off. Harry of Tulsa told me about this.

There are nice one man hot air balloons without a gondola
already so this is not a nutty idea.

Hank

At 01:05 AM 8/4/02 +0000, you wrote:
>Is that really true, or are they there but abandoned?
>You seem to be saying they've been removed.

Since one of my other hobbies involves railroads... (I may be the only qualified steam locomotive engineer on the list. <grin>) ... I feel qualified to answer this.

It would be fairly unusual for the rails to be left if the railroad were abandoned. They have enough intrinsic value to make salvaging them worthwhile and most governments wouldn't stand for them being left there.

On an economic side note: Some years ago one of the main companies that builds track maintenance equipment came out with a machine that immensely sped up the effort of replacing ties by chopping them into 3 pieces and kicking the ends out from under the rails. You would be hard-pressed to find one in service today because the railroads quickly figured out that the extra time it took to replace them without chopping them could be more than made up for by sales to landscape contractors. I've heard that some companies that deal in used ties actually contract with the railroads to pick them up at the nearest grade crossing.

From: Craig Brunson
Topic: 3411 Message: 3434

The railbed your referring to was the Pacific, Idaho, & Northern RR (PIN) that ran from Weiser, I think all the way to New Meadows. Later it was cut back to the saw mill at Tamarack. I have only found references to the PIN in a few books on railroad history. I lived in Weiser from 58 to 71, and had a high school friend who's father was stationmaster at the Weiser UP station. He was the first one that told me about the line. I am sorry to hear it has been removed like so many others. Sounds like you had a great flight. I saw about 6 hits via rf over here in Hillsboro.

According to Street Atlas that would be about 313 miles line of sight. The capsule has a J-pole antenna made out of twin lead that hangs upside down. I built it from the instructions on this link.

http://www.n6mrx.com/Antenna/Pocket%20J-Pole.htm

The radio is a 340 milliwatt Alinco DJ-S11T.

Stephanie, thanks for the help you did in finding the
right road to head for the balloon. Sometimes more
help can be had by a base station then if we were
running blind (so to speak) down the highway, trying
to find out were we are to go.

Again, thanks

From: Jeff Melanson
Topic: 3438 Message: 3438
Attachments: 1 described; binary payloads are missing from this source WARC

Hi Ralph,

I have several record submissions for this flight for your
consideration.

Here's the basic information for all the record submissions:

Group
Treasure Valley Near Space Program (TVNSP)

Contact
Jeff Melanson kd7inn@...

Web Page
http://www.voiceofidaho.org/tvnsp/

Mission ID
TV02D

Date and Time of release
Aug. 3rd 2002, 10:51 am Mountain time

Envelope Model
Kaymont KCI 200

Payload Weight and Capabilities
2.3 pounds. This capsule contained the following. GPS 35,
Tiny Track II, Alinco DJ-S11T, Twin lead J-pole antenna.
Transmission rate every 21 seconds.

Free Lift
3 pounds.

Ascent rate
1567.4 fpm

Maximum Altitude ASL
52,539 ft.

Ground Track Distance
42.9 miles.
Two battery packs each with 4 AA NiMH.

These are the categories we believe that we qualify for:

Lowest Reported Maximum Altitude
52,539 feet.

Highest Continuous Ascent Rate
1567.4 fpm averaged over 10,000 ft.
First time stamp 17:10:36 Altitude 30,611 ft.
Second time stamp 17:17:10 Altitude 40,916 ft.
10,305 ft/6.57 min = 1567.4 fpm

Shortest Great Circle Distance, Release to Touchdown
42.9 miles

Lightest Payload
2.3 pounds

Touchdown Prediction closest to Actual Coordinates.
Randy sent you a prediction before launch.

3439. Tiny Trak II schematic?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-05 14:55:19 UTC
From: kd7pit
Topic: 3439 Message: 3439

Hi all,

I was wondering if anyone has a nice schematic of the Tiny Trak II that they can send to me? I'm having a difficult time finding one off the internet so I thought maybe someone has one left-over from the kit or on their computer (such as a piture or PDF file.) I'm consulting with a long time friend to help me with the architecture and artwork for a custom board for a future capsule. Thanks for any help!

Also, good flight Saturday, I had a lot of fun. My upper left leg is a little sore though. I guess that's what I get for taking the scenic route to the capsule.

Justin, KD7PIT

And how about Paul's change in his facial features. I
bet he will remember his hike for a while.....

> The GPS was a heat source on this flight.

I'd expect it and the radio to be heat sources on every flight. Nothing different as far as this flight.

> The higest recorded
> temperature was over 100 deg F.

What was the air temperature at launch? As I remember from the wx forecast I posted, it could have been in the 90's. If the 100 degree reading were early in the flight, that air temp (or the vehicle temp on the ride over) would put the 100 degrees in perspective.

This was not the usual TVNSP crack-o-dawn launch so ground air temperatures had time to creep up.

Where was the thermochron situated? Was it close to or touching the GPS?

Hank

3447. Near Space Calendar

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-05 21:38:23 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3447 Message: 3447

I'd like to get a calendar with near space photos. Walmart and other places make calendars using photos that you give them. Would anyone be interested in ordering a calendar? I'd also like to get photo submissions for the calendar. So if you have a photo that you took that made you proud, please let me know and I'll try to include it. I don't want all photos to be just photos taken from capsules in flight.

Paul

Justin,

I'm surprised you didn't get dozens and dozens of hits to
the Tiny Trak II website.

http://www.byonics.com

I guess the schematic will be included in the zip file
available there for download. I have that set of files
somewhere but I can't remember what form the schematic
is in.

There is even a yahoogroup devoted to Tini Track complete
with occasional answers from the TT2 designer himself.

Hank

Thanks. Ya, I will be at the Friday meeting, possibly with my friend who will help me out with my capsule. The only schematics I have found are hand drawn sketches that I couldn't make out (or they used too much electronic jargon thats over my head) and schematics of what the builder did (such as using different variable resisters or caps) and not what the original design was. I downloaded the zip file from Byonics but all I got was a small program to "encode" the TT but no documents. Thought maybe there was a place I could find the info quick. Thanks again

3452. Aug 24th flight

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-06 04:38:30 UTC
From: Jeff Melanson
Topic: 3452 Message: 3452

TVNSP,

Aug 24th Flight.

This flight will be Paul and Stephanie's capsule's. Paul's capsule will have a tracker and a geiger counter. Stephanies capsule will have a tracker and a camera.

Total payload weight will be 10 pounds.
The balloon is a Kaymont 1500 gram.
Burst Altitude is 93,000 feet.
Ascent rate is 950 fpm.
Descent rate is 1200 fpm.
Free Lift will be 3.5 lbs.
Nozzle lift will be 13.5 lbs.
Time to Burst is 1.6 hrs.
Initial balloon diameter is 8.1 ft.
Burst diameter is 31 ft.

Paul has the 1500 gram balloon on the way. Mike has a partial helium tank. I will pay for another helium tank. Mike, I will drop off the money at Sheehan's this week for our account. We will still need one more tank. Can anyone else help out?

Jeff

How much is helium and what do we tell them? We can help out with part of the other tank.

Was this the launch that was to be at a different time of the day?

Bill

Hi Bill,

The Sept 7th launch will be at 9:30 am. I'm not sure about
this one. Paul?

One tank of helium is $57.00. This is the educational
discounted price. We tell them it's for "Treasure Valley
Near Space". The word "Program" is chopped off from the
name. It doesn't fit in there computer form. Yes you can
help out with part of a tank. You just put whatever amount
you want on the account.

Just a thought. If you give the money to the VOI balloon account you might be able to use the deduction on your taxes. The money can be given to Sheehan's via credit card the same day!

3457. Re: Record Submissions for Flight TV02D

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-06 13:40:37 UTC
From: Ralph Wallio, W0RPK
Topic: 3438 Message: 3457

Jeff,

Well done! Thanks for submitting several entries for our collective record.
My regards to the entire TVNSP Team.

--Lowest Reported Maximum Altitude--
This record category is AGL, Above Ground Level. DTED ground elevation ASL
at burst coordinates was 666m (2185ft) which I subtracted from GPS
altitude and posted a record entry of 50,354ft.

--Highest Continuous Ascent Rate--
This is tricky. TV02D telemetry does not have time stamps and GPS altitude
reported in meters is converted to feet before transmission. Time
calibration can only come from mobile $GPGGA/$GPRMC data embedded before and
after TV02D telemetry.

Just before launch, 164911z-65119z, there were 15 stationary $GPGGA fixes
when reported altitude varied 780.9-784.2m (2562-2573ft) [vehicle assumed to
not be in unstable levitation]. During the same interval payload reported
altitude was a constant 2555ft. It appears payload software is using
integer math with inherent truncating errors.

To be fair, these uncertainties cause me to use times of the last
$GPGGA/$GPRMC frame before the starting altitude and of the first
$GPGGA/$GPRMC frame after the ending altitude:

Ralph

I would like to take the credit for this record, but it was calculated by Jeff.
He used my facilities to do the calculations before the team went to the actual
launch site. We just used my email address to send the entries to you.
Just grateful to be part of the team.

Also,i believe my lat/lon for the launch site was off by .1 to .2 of a mile
in my Balloon Track program. Probably close enough for "horse shoes,"
however not sure for "hand grenade" carrying balloons ;-)
Not sure if Jeff noticed that or not. I caught it after we got home from flight
later in the evening.

Ralph, thanks for taking the time to calculate and post our record attempts.

I can shoot a PCB for your TT-2. You'll have to buy a programmed
PIC from Byonics.

Helium is $57 a tank. Tell Sheehans, on Century Drive, that you'd
like to add money to the Treasure Valley Near Space account.

> The GPSL piece you wrote up and posted was very good and
> answered a lot of the basic questions.

Thanks, I've rewritten parts of it based on inputs and my rereading.
I was notified that QST has received the article. I'm waiting to hear
if they will accept it for publication.

> Wondering if you have sent anything smaller to QST along
> the way.

No I haven't. I am too busy trying to get my sundial class, book
written, next flight ready, present to NHABG, and arranging to
transport cosmic ray telescope mirrors to Boise to do any more.

Hank, do you want to put something together?

This reminds me, U of I in Moscow (Idaho, not Russia) is looking at
starting a balloon program. It would be supported by the Idaho
Space Grant and is planned to be an entire course at the
university. Eventaully they hope to test satellites.

I offered TVNSP help (I knew you wouldn't mind). We may get
some visitors (so everyone look sharp) to a launch or be asked to
present on amateur near space. Along with giving classes (where
you have to put together notes) and preparing your notes for
publication in ATV (as I know you all are planning), we should also
be ready to complile them into a booklet that can be given to U of I.

Do I need to crack the whip anymore? (and you thought this was
fun!).

This is just a head's up, so to speak. We may be helping our
second universirty get their balloon program started. Dr. Atkinson
is definitely interested in what we do. And since we're so close
and have so much experence, I think we are the logical group for
them to ask for help. Dr. Atkinson will not be back in Idaho until
late August, so not much will happen until then. We have some
breathing space. The Space Grant has been notified about the
program. Dr. Atkinson asked me if we really reached 94,000 feet
on our balloons. I told him the highest one of our balloons reached
was 114,600 feet. I forgot to mention that BOI reached 118,000
feet. Of course I won't mention that we didn't get the balloon back
(but that's a trivial issue, since we know how to prevent that from
happening again).

I do **only** in the sense that I'll do this if it otherwise
wouldn't get done. The logical choice is someone who
was there, but now that there are these accounts, the most
comprehensive from you but from others as well, I have something
on which to base a shorter item.

I'll probably end up by picking stuff from what you've done
(not word for word) and crediting you for the basic source
information.

3469. press for GPSL2002 and 2003

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-06 21:02:24 UTC
From: n1ltv
Topic: 3467 Message: 3469

Paul,

I'd like to reiterate that I think it would be highly beneficial that some planning go into getting a proper post event press release written for GPSL2003.

This did not happen this year for GPSL2002 and it seems like it would be simple enough to do. A few paragraphs about balloons launched and attendance, together with a small selection of photographs.

As far as I can tell QST and I still do not know which of the many (a good thing) photos taken of GPSL2002 are cleared for publication.

This press release creation and coordination is properly a function of the event organizers, and is not nearly as well done afterward on a catch as catch can basis as we are presently finding ourselves doing.

It's better late than never, but I'm just pleading for this to receive some of the attention it deserves next year ahead of time when it should be easier to implement.

Sometimes it's good to **uncrack the whip**. What I mean
by that is take a few less items and get them done well.

To me the TVNSP schedule might be too crowded as it stands.

Justin,

I don't know what you downloaded, but I just went to

http://www.byonics.com

and downloaded a beautiful pdf file that is a TT user
manual complete with parts list, photos of the board,
and a **machine drawn schematic**. This was in a zip file
that contained the PIC code too.

I will have to say the schematic is somewhat coarse when
you use the Acrobat viewer to make the diagram fill the
entire computer screen, but it's perfectly legible (looks
like the conversion of the schematic to pdf was not done
exactly right).

I'll try to neaten it up and email it to you or post it
to TVNSP list.

Hank

From: Jeff Melanson
Topic: 3452 Message: 3480

These are two different events. For the Aug 24th flight we
need the helium. For the Sept 7th flight Bruneau Dunes is
paying the $100 for the helium. The balloon for the Aug 24th
flight is on the way. We still need a balloon for the Sept
7th flight.

Paul,

The question I was trying to ask is what time are we
launching the Aug 24th flight?

Craig,

Do you happen to still have the records of the 6 RF hits you
recieved from TV02D? If you do I would like to submit them
to Ralph Wallio for the following category:

Greatest Telemetry Downlink Reception Range
Range calculated between GPS derived payload coordinates and
observer coordinates. Proof of communications or telemetry
reception and evaluation as well as payload and observer
coordinates required.

Thanks,
Jeff

3483. VOI account? Re: [tvnsp] Aug 24th flight

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-07 05:02:33 UTC
From: Bill Herrmann
Topic: 3452 Message: 3483

At 07:34 AM 8/6/02 -0600, you wrote:
>Just a thought. If you give the money to the VOI balloon account you
>might be able to use the deduction on your taxes. The money can be given
>to Sheehan's via credit card the same day!

I'd be glad to - just need to know how to get it there. (Unlike Jeff I won't be at Friday's meeting so I can't bring a check there.)

Note: I was unable to find an address on the VOI pages except in the membership application. That says PO Box 812, Boise, ID 83701 and also says allow 2-4 weeks for processing. Clearly we want the helium $$$$ to get processed a little faster than that.

Bill

p.s. Still interested in where/when the flight is going up. I may not be able to provide much more than moral support, but... (PAL Soccer didn't coordinate their soccer schedule with my other activities very well!)

Doug said just send the donation to VOI and mark it for the balloon
fund. Then contact him to pay the money onto the helium account at
Sheehans.

From: Randy Farley
Topic: 3467 Message: 3485

verhap@... 08/06/02 02:41PM

Now your making me feel re....al guilty.
U of I is my old Alma Mater. The vast rolling hills of the "Palouse" wheat fields could be another interesting terrain to chase balloons on.

Be Glad to help if the time is right. The drive from our area is about 5.5 hours via the improved highway 95 goat trail. Was up their last summer for company business. Nice scenic route for newbies.

Will my 60's tie dye shirts or 70's bell bottoms be appropiate attire ;-)

wrote:

This reminds me, U of I in Moscow (Idaho, not Russia) is looking at starting a balloon program. It would be supported by the Idaho Space Grant and is planned to be an entire course at the university. Eventaully they hope to test satellites.

I offered TVNSP help (I knew you wouldn't mind). We may get some visitors (so everyone look sharp) to a launch or be asked to present on amateur near space. Along with giving classes (where you have to put together notes) and preparing your notes for publication in ATV (as I know you all are planning), we should also be ready to complile them into a booklet that can be given to U of I.

Do I need to crack the whip anymore? (and you thought this was fun!).

This is just a head's up, so to speak. We may be helping our second universirty get their balloon program started. Dr. Atkinson is definitely interested in what we do. And since we're so close and have so much experence, I think we are the logical group for them to ask for help. Dr. Atkinson will not be back in Idaho until late August, so not much will happen until then. We have some breathing space. The Space Grant has been notified about the program. Dr. Atkinson asked me if we really reached 94,000 feet on our balloons. I told him the highest one of our balloons reached was 114,600 feet. I forgot to mention that BOI reached 118,000 feet. Of course I won't mention that we didn't get the balloon back (but that's a trivial issue, since we know how to prevent that from happening again).

The 1500 gram balloon arrived yesterday. I have it at home. We
can get by with a 1000 gram balloon for September, it that will
help. We'll need helium and a balloon for the early October, early
flight. I'll buy a 200 gram balloon for the late October flights and
there should be enough helium left over for Jeff's and mine trackers.

I'm willing to buy another 1500 gram balloon for the October flight,
so we just need to reserve some helium.

Paul

> The question I was trying to ask is what time are we
> launching the Aug 24th flight?

It's going to be a 1500 gram balloon, so I'd like to launch at sunrise. Would a 6:00 AM flight work for everyone?

I have to wind the new winders yet. The first lanyard will be the typical lanyard. The second lanyard will be cut, rather than having it's loop pass through the balloon ring.

Paul

3488. ISP Launch

Can we put a simplex repeater on the ATV flight? I'm wondering about sending up some QSL cards for people who work the repeater. If that's going to create a problem with either weight or RFI, then perhaps we can send QSL cards to anyone who sends proof of reception of a packet from the flight. The QSL cards should be sent up on the balloon. Perhaps we could make mini-QSL cards to save weight.

Ideas?
Inputs?

Paul?

3489. NWAPRS Summer Gathering Info

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-07 19:17:57 UTC
From: Stephanie Steele
Topic: 3324 Message: 3489

I drafted a real work of art for your reading pleasure yesterday, and upon penning a signature managed some fancy key combo that deleted the masterpiece. Bummer. This time I'll try to be brief.....

As prevsiously mentioned, the annual NWAPRS Summer Gathering will convene Sept. 6-8 at the VaLLLey Camp in North Bend, WA. The location is on the east side of Puget Sound WA, and just north of I-90. The nwaprs.org web pages have summaries of previous meetings, and directions how to get there. I will update those upon my return from vacation in AZ.

This is truly THE APRS EVENT of the northwest, and I encourage to break away from whatever ties you down and join us for a weekend of fun time with APRS and fellowship. Our sponsors, Thom and Tina Proehl, are waiting to take your RSVP. Don't forget to mention what accommodations you need (tent space, camper/RV w or w/o hookup space, bunk room, etc). There is a motel just down the road for those who desire those accommodations. The camp provides excellent opportunities for walking and playing. There is plenty of room for any sporting event. Families are encouraged to come.

There will be food..... if you bring it. We encourage attendees to bring a couple side dishes to share in our meals together. We'll have the grills going Friday night, and Sat. lunch and dinner. The frying pans will be hot Sat and Sun breakfast. I'll provide the pancakes, you bring your eggs and sausage/bacon. Breakfast will follow Bill Nadwornick's award-winning morning exercise program that will commence precisely at 0600 Sat and Sun mornings. You won't want to miss out this sensational opportunity.

As usual, we'll pass the collection bucket for donations, all of which go to the VaLLLey Camp for their generous hospitality.

Program details will follow later on. Don't let that be the reason whether you come or not. Here's a great opportunity to match callsigns and faces, and join in on some good conversation and time spent with others who we share this interesting hobby.

All for now. The other message (lost) was twice as long, and I need to get ready to take the family out to the AZ Sonoran Desert Museum.... or is it Dessert. Whatever it is, we'll have fun.

Note for Thom/Tina: Please reserve me a camper spot with hookups. I'll be bringing along my new (used) Casita travel trailer.

Hope to see you all there.
David/K7GS

I have four MIM PCBs. I'm using one as a test. If anyone has a MIM that you'd like to mount to a more substantial base, let me know. The PCB provides power to the MIM, easy access to digital and analog ports, and provides optional connections to the ADC for monitoring main power, internal temperautre, and external temperature.

I'm currently working on the documentation, which will eventually find it's way into my book.

I also need a MIM. If you have a spare you could sell, please let me know.

3496. Cybiko Batteries

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-07 22:17:18 UTC
From: Stephanie Steele
Topic: 3496 Message: 3496

Anyone who purchased the Cybiko units and are in need of batteries for them please let me know. Cybiko has told me that they no longer support any of these units for parts or batteries and will not supply any batteries for them. I have found a supplier that has a limited number of the batteries and I have ordered most of what they had. Let me know how many you need. I will put any unsold batteries on Ebay once you all have gotten what you need.

3498. Re: [tvnsp] Cybiko Batteries

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-08 01:57:13 UTC
From: Jeff Melanson
Topic: 3496 Message: 3498

Stephanie,

I called Cybiko on Tuesday and I was told that they still
intend to fill the orders but (here's the problem) they
won't have the batteries for a very long time. The company
that they origanally got the batteries from no longer makes
them. They are trying to work out a deal with another
company to manufacture the batteries. By the time they get
more batteries the Cybikos will probably be obselete. What
upsets me is that these units are still under warranty.
Might as well go with another source. I need six batteries.

3501. Recomendations for GPS35 wiring scheme?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-08 05:09:13 UTC
From: Bill Herrmann
Topic: 3467 Message: 3501

I'm finally getting around to wiring up my GPS35 with a plug. Knowing several of you have already done so..

Any recommendations on which signals to put where? It looks like there's 2-3 data receive wires etc.

I was figuring on wiring it with a standard DB9(F I think - never can remember which way IBM screwed that up) and running the power wires out the back of that. Any other trick connection methods I should consider?

Bill

I may be able to provide some long distance support for the first part of the flight but won't be able to be home for the whole thing.

>I have to wind the new winders yet. The first lanyard will be the
>typical lanyard. The second lanyard will be cut, rather than having
>it's loop pass through the balloon ring.

One recommendation there - Do not tie the cord off to the winders. That way if all else fails the winders just fall clear.

Rather than cutting the lanyard (or having a loop in the first one) I'd recommend tieing them off to a short length of PVC pipe or wood dowel. (The dowel is probably a better choice do to the less smooth surface.) Use a clove hitch (type of knot) and it can be easily released, but will hold fine. The other option would be to go to a boat store and get a cleat. Place that on a board and you can tie the lanyard to it and release easily.

I'd be glad to show anyone how to tie a clove hitch (they're very simple) but I'm sure there are some illustrated ones on the net. (I won't be there this Friday.)

How about we just cut both lines like was discussed during at least one
of the meetings. I just can't see putting the launch at risk to save six
inches of string.

Courtesy of Jeff:

Here's the answer for the GPS wiring question.
TXD1 - White wire from GPS35 to pin 2 of the DB9
connector.
Ground - Black wire from GPS35 to pin 6 of the DB9
connector.
The black wire is signal and power ground. You will have to
run this wire to pin 6 and your battery ground.
Power - Red wire to battery plus.

Hi Jeff,

When I called them today they told me that they have discontinued all hardware support for these units and the newer model too. They said that the company has not produced any units or parts for over one year and do not intend to offer any hardware support now or in the future. I got the support person to admit that the company is for all intents and purposes out of business and will probably drop all support soon. They were not interested in helping me find a source for batteries at all. I agree that this is not right for units still under warranty.

From: Craig Brunson
Topic: 3467 Message: 3506

Also, tie the RXD - Blue wire from the GPS35 to pin 3 of the DB9, so you can program the gps if desired.
I tie the red power lead to pin 9 when putting it into one connector.

Stephanie, please give me a call. I know where Randy lives,
perhaps we can meet there. I'd like to bring some equipment and
show you what I'd like to bolt to your airframe. After that, I'd like to
take it home and do the work.

From: Jeff Melanson
Topic: 3511 Message: 3511

TVNSP,

Friday's meeting is 6:30 pm @ Jade Garden. On the agenda is APRS+ software training. Randy (N7GPS) is the instructor. This is not a balloon specific topic so I would encourage anyone who wants to learn about APRS+ to come and join in. I recommend that you bring your laptops and equipment if you have it.

Jeff

3513. Re: [tvnsp] Recomendations for GPS35 wiring scheme?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-08 23:59:33 UTC
From: Tony Barrett
Topic: 3467 Message: 3513

Hi Bill,

Yes, its a DB9 "Female" according to my parts from Radio Shack that are still sealed in their original packages.

Yes, that's the way I did mine. That way I can connect to a PC or, with the proper "Y", the "radio port" a KPC3+. I've built one TNC "Y" and have the parts to build a couple of more. With the power pigtail on the GPS side you end up with a double "Y".

The +12 connection does NOT connect to the DB 9 at all. The wire merely comes into the back of the housing and connects to the GPS cable inside the DB9 housing, but does not connect to the DB9 sockets. I did connect the ground lead from the PowerPoles (on about a three foot length of cable) to the GPS AND the DB9 AND the DB9 housing shell (heat shrinked and soldered of course).

Here are the connections I used and it works great:

Pin 2 on the DB9 is data from the GPS and the wire on the Garmin 35 is WHITE (TXD1).
Pin 3 on the DB9 is data to the GPS and the wire on the Garmin 35 is BLUE (RXD1).
Pin 5 on the DB9 is ground for the GPS and the power source and the wire on the Garmin 35 is BLACK (GND - Power and Signal Ground).

Pin 3 is optional, but useful if you want to program the device to send specific strings. I have the programming software around here somewhere.

I did not connect any of the other wires on the Garmin 35 to anything.

I'd be glad to bring one of mine in to work to show you if you want to see all the fancy stuff I did with shrink tubing and hot melt.

Stephanie and Jeff say pin 6 for ground. I'm using pin 5. My Garmin built cables for my GPS II+ and my GPS III both use pin 5 for ground. I found web sites that also show pin 5 as ground.

Craig suggests connecting the red power lead to pin 9. With all the various PC configurations I don't think I'd do that. Most of the time it won't work and it may damage something.

My Garmin built cables do not have the power lead connected to anything on the DB9 female (PC) end.

73,

Tony

Very nice, Mike. I hope as time goes on you can add a
few more. Sorry to hear your computer went haywire just
around the time of 02D I guess.

That campground looks very cozy and the weather must have
been excellent! Nice to not have to use headlights to
do launch prep. No civilian onlookers attracted by
the unusual spectacle?

Did you folks have a chance to watch the balloon in such
bright, clear conditions or did you have to pack up
and keep moving?

Looking forward now to a few closeups of the payload
interior since a picture is worth a thousand words.

It's neat looking at the landing photo (3rd in the series) because it appears like we landed on Mars with the iron oxide red soil. One could probably photoshop out the sage brush and add a "Yogi" rock nearby and JPL might be interested! :-)

From: Jeff Melanson
Topic: 3520 Message: 3520

Hi All,

http://photos.groups.yahoo.com/group/tvnsp/lst

In the first picture called "Getting ready to launch" from left to right you see Randy (N7GPS) holding the 200 gram balloon, Paul (KD4STH), John Stone (K7JPS) AKA John the younger, and me, Jeff (KD7INN).

In the second picture called "3....2....1....Launch!" I am holding the capsule waiting for the countdown. You can see the J-pole antenna hanging down. That's Paul laying down on the job.

In the third picture called "Landing Pic" shows the brightly colored lunch bag capsule with the 24" parachute. You can also see the J-pole antenna laying on the ground. Even with the antenna on the ground the signal got out pretty good. We were on a road .7 miles away from this spot with a couple of hills between us and received the signal with no trouble. The parachute did not come with the straps at the top that the load line was tied to. My wife sewed those on for me.

In the forth picture labeled "Check out the terrain" from left to right is me again, then Paul and John. Mike and Justin are there but not in this picture.

Crew members attending this flight:

Jeff
Paul
John Stone and family
John Knapp
Deb Knapp
Justin
Mike
Randy

Stephanie had gotten home from a late work shift and monitored our progress and was helping us with directions to the landing site.

The batteries are $4 each. I know where to find a few more (as of yesterday) but no more exist that I can find. There are no more being made nor any firm plans for any to be made. Can't say if it's worth having spares. Each unit takes two batteries and I plan on having spares for mine.

I'll have to show you how I did my cable for the GPS port. I used a hood designed for back to back DB9 plugs and brought the cable out the side. It seemed less prone to damage.

>I'd be glad to bring one of mine in to work to show you if you want to see
>all the fancy stuff I did with shrink tubing and hot melt.

I'd like to take a look at that sometime.

>Stephanie and Jeff say pin 6 for ground. I'm using pin 5.

Good catch! Pin 5 would be correct for a DB9 style RS232 connector. The KPC3 etc. use pin 6 and/or 9 for ground. I'm betting that's where the difference came in.

Thanks to all who responded!

Bill

3524. Re: [tvnsp] Recomendations for GPS35 wiring scheme?

Yahoo group: tvnsp (2000 — 2002)

But I had to build a "Y" for the TNC to allow me to connect the radio anyway, so on the GPS end of the "Y" I made it look like a PC port. That way I can plug all my GPS units into my PC or my TNC. This also allows me to use factory built cables between my GPS and the TNC "Y".

Same here. I get the same error Jeff reported. No photos.

What's the secret to seeing these pictures? Is this a Netscape / IE thing?

At least you can do that! For a variety of reasons I don't have a Yahoo
account. (No, you don't actually need one to sign up for lists.)

Oh well!

Bill

3528. Map of predicted TV02D path

Yahoo group: tvnsp (2000 — 2002)

From: Hank Riley
Topic: 3528 Message: 3528
Attachments: 1 described; binary payloads are missing from this source WARC

This is a graphic showing the predicted path on ascent and descent of TV02D. The prediction was actually made about 45 minutes before liftoff and is very similar to the one posted to list Saturday morning (this one is slightly closer to the actual landing spot).

The blue color dots represent a rising balloon and these dots change to red northeast of Weiser.

To better show detail, a composite has been made of two images and here they are not aligned in the left-right direction so a red bar shows the place at which they're joined. Later I'll make a nicer one without a visible splice.

On Friday I'll upload the actual balloon track.

Hank

3529. Accessing Pictures

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-09 11:46:09 UTC
From: Jeff Melanson
Topic: 3529 Message: 3529

Hi Tony,

In my case I had to rejoin the Yahoo group. It's weird
because I was still getting email from TVNSP fowarded to my
earthlink address an I could still post to it but but my
Yahoo address showed I was a not a member of any groups and
my earthlink address was not verified. This had something to
do with the time that our email group changed from E groups
to Yahoo groups. For a long time nothing worked right for me
but it's looks like it's all working now.

Stephanie

****

Friends are quiet angels who lift us to our feet when our wings have
trouble remembering how to fly.

****

"They that can give up essential liberty to obtain a little temporary
safety deserve neither liberty nor safety."

Benjamin Franklin (1706-1790), Letter to Josiah Quincy, Sept. 11, 1773.

"Those who desire to give up freedom in order to gain security will not
have, nor do they deserve, either one."

President Thomas Jefferson.
1743-1826

3532. Help Moving Mirrors

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-09 16:41:54 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3532 Message: 3532

I have three 48" mirrors in SLC that need to be moved to Boise.
The mirrors use to be a part of the Flys Eye cosmic ray telescope.
I was planning to bring them back on a U-Haul trailer, but my Jeep
is not drivable at this time. Is there someone who might be able to
tow a trailer for me and the Discovery Center to move the mirrors
back? I would pay for your gas and meals.

The mirrors are in 6 foot frames and weigh 75 pounds each. They
are 9" deep. I figure we can load all three inside a trailer and wrap
them in moving blankets.

Let me know if you can help or if you know someone who might be
able to help.

Thanks,
Paul

Mike, I'm getting blank images.

Can you call me so I can arrange to pick up the parachute fabric. I
have some time before shcool starts and i'd like to begin sewing
the 'chute.

From: verhap@occ1.sd01.k12.id.us
Topic: 3452 Message: 3537

Let's meet on Sunday. Would anyone else like to attend? I'll call
Randy and Stephanie to arrange the time.

Stephanie, I plan to mount my camera and scan platform on the
outside of your capsule on one of your quads. I'll make the cable
to connect my flight computer to to the camera and servo. Do you
have a boom to mount your antenna on? We'll put the antenna and
camera on opposite sides of the capsule. I'll program the flight
computer to photo the ground throughout the flight. It will try to
snap a few pix just after lift off and attempt to get the launch crews
during their typical post launch panic. At 85,000 and 90,000 feet,
the camera will photo the horizon several times. We'll also try for a
few pix as soon as descent is detected. Any left over photos will
be reserved for the last 2000 feet of descent. We'll try to photo the
landing site and try to record the shadow of the parachute.

We'll put your capsule on the bottom. When you photo the ground,
there will be no capsule in the way. When you photo the
balloon/parachute, my capsule will be in the chaotic scene.

My capsule will carry the second APRS tracker, geiger counter
and weather station. We'll position our antenna on opposite sides
of the stack. John the Younger, can you attend and begin the
checklist?

Paul

3538. Balloon Ascent Speeds

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-09 18:05:30 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3538 Message: 3538

In my book I discuss technical issues like the lift of helium, descent speeds of parachutes, cosmic rays, etc. The next topic I'm tackling is the ascent speed of a balloon. Here's what I have for my notes so far. I'm looking for input, because I don't have the complete picture yet. Please spend a little time looking these notes over and making suggestions. Thanks.

A. Intro

We know the balloon will expand as it rises due to decreasing air pressure. As a gas expands, as in a balloon, it cools. This cooling decreases the volume of a gas. We can see that during a flight that the balloon expands a lot more due to reduced air pressure than it contracts due to cooling air temperatures (both inside and outside the balloon). So cooling has a minor effect compared to reducing air pressure. The forces acting on a balloon are three, payload weight (W) pulling down, lift (L) pulling up, and drag (D) pulling in the direction opposite of the balloon's motion (so drag pulls down, just like the weight). Looking at flight data, we see that the balloon ascends at a constant rate for the entire flight [1]. As long as there is no net force acting on a balloon (or any object for that manner), it moves with zero acceleration, or constant velocity. Since the balloon climbs at a constant veleocity, the force of lift of the balloon is balanced by drag and weight, D + W = L. Lift and weight are constant on a balloon flight [2], therefore the force of drag must be a constant throughout the flight also.

B. Drag

The equation for drag is given as,
D = Cd * Ra * sq(V)/2 * rho

where,
Cd is a coefficient of drag
Ra is the reference area
sq(V)/2 is the square of the velocity, divided by 2
rho is the density of the air.

Cd is a dimensionaless constant. This means it's simply a number and does not have any units (like pounds or feet) attached to it. For a sphere, Cd is about 0.5

Ra is an area you choose to use. If you select a different area as your Ra, then the Cd for that Ra is different, but Cd is still just a number

I only what to determine how ascent speed changes as the variables change, so I'm going to treat this equation as a relationship of proportionality and drop the constants for the rest of this discussion.

When you look at the US Standard Atmosphere (a model of how air pressure, density, and temperature change as a function of altitude), you see that the change in air density closely tracks the change in air pressure. So I'm going to replace air density with air pressure. The reason I do this is that we can see the change in air pressure changes the balloon's volume and therefore it's reference area. As a Ra, I'm going to select the frontal area occupied by the balloon. This Ra is proportional to the two-thirds power of the volume. The balloon's volume, ideally, is proportional to the inverse of the air pressure. Observations show that the balloon's vertical velocity, its ascent rate, is constant throughout a flight. So sq(V)/2 is also a constant. When I combine like terms and move the constants out, I end up with the following,

D is proportional to (volume)^2/3 * pressure

Which simplifies to

D pro to 1/(pressure)^2/3 * pressure

Which simplified to

D pro to (pressure)^1/3

However, D must be a constant, whereas pressure is not a constant! So what's wrong here?

The change in temperature can't be responsible for adjusting the change in volume (that is due to changing air pressure) because we see the temperature change in opposite direction in the tropo and stratosphere. And yet, the ascent rates in both the tropo and stratosphere are both constant.

So it appears to me that Cd is not a constant throughout a flight.

C. Cd

Cd models drag's depenedencies on things like shape, air viscosity, and air compressibility. The balloon's shape does not change significantly during a flight. The air compressiblity is not siginificant belows speeds of 200 mph. This leaves only air viscosity. Is the change in the air's viscosity proportional to the cube root of the air's pressure? If so, the change in Cd would oppose the chnage in drag caused by the change in air pressure (or more exactly, air density). Does the Cd of an aircraft change as the aircraft climbs?

Note 1
There is a knee in the ascent speed of a balloon as you approach

the stratosphere. In the startosphere, the air temperature increases as the balloon climbs. Perhaps the slight extra increase in the balloon's diameter due to increasing stratospheric temperatures increases the balloon's drag slightly, causing it to slow down a bit. As a future experiment, does a black balloon rise faster than an identical white balloon or slower?

Note 2
The lifting ability of helium does decrease with decreasing pressure. But this amounts to only something like a percent or two. This is not enough to significantly effect our numbers.

Paul

I'm literally headed out the door right after I send this and will be out
of town this weekend. However, if nobody else is able to I could tow the
trailer for you.

Can go up to 4500 lbs of trailer on one rig and 2000 on the other.

Bill

3540. TVNSP 02D pictures posted on web for easy viewing

Yahoo group: tvnsp (2000 — 2002)

From: n1ltv
Topic: 3540 Message: 3540

It's funny, I was thinking that it's pretty slick
how yahoogroups displays uploaded pictures.

However if even several people are having troubles
with viewing the pictures there that's not good.

I decided to do a quick photo gallery on my webpage
to remedy this difficulty, and secondarily show
how it takes only a little time and a little effort
to get this stuff on the TVNSP web page where it
really belongs. I know Mike when he gets his computer
all straightened out will be getting the TVNSP web page
in gear with updated info, data, and pics.

No special web software was used for this, and I use
an old $49 computer (just barely above a 486) and
a slow KMart (really!) internet connection.

See Mike Garske's nice 02D pictures at:

htp://www.geocities.com/n1ltv/tv02d.htm

> This means *it's* simply a
> number

Correct use of it's. (short for "it has" or "it is")

> The reason I do this is that we can see the change in air
> pressure changes the balloon's volume and therefore *it's*
> reference area.

Incorrect use of it's. Should be its.

This mistake is rampant in cyberspace. If your book ends
up being published by an outfit like Tab Books, a lot of these
<it's its > mistakes will slip through and end up in print.

I would not have bothered mentioning this if it were just
an isolated incident, but some of your other material
contains this consistent error. I think also worth mentioning
because people are seeing it so much now they think this is
the correct way.

Hank

Paul,

You may have to wait for my book to be published. :)

Seriously, if I am able to derive the equation for you, I'd
like to get credit in THE BOOK.

> So it appears to me that Cd is not a constant throughout
> a flight.

No, it probably changes slightly, but you have missed an
important part of the entire situation. Cd can be a constant
for the purposes of approximation and the ascent speed will
be constant.

Hank

> Since the balloon climbs at a constant
> veleocity,

Paul,

Ah, the above appears to be a sort of implied circular argument.

You have not established that the balloon ascends with constant velocity, or if so, why. It would be very good to briefly mention the analogous situation of terminal velocity of a falling object in the atmosphere. It accelerates less and less (while speeding up) approaching asymtotically a maximim velocity which is called the "terminal velocity."

The rising balloon is the same thing, except upside down.

When first released it accelerates until it reaches its upward terminal velocity (doesn't take long).

Funny this subject has come up because when I mentioned to you about a paper for GPSL2002, it would have treated these very subjects. I wrote a computer simulation to model the acceleration and velocity of a falling body which involves the solution of simultaneous differential equations.

There was not enough time to get the paper written and to make sure everything was okay for accuracy.

Hank

should be maximum.

3545. Re: [tvnsp] Re: Stephanie's Capsule

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-09 18:11:04 UTC
From: Stephanie Steele
Topic: 3452 Message: 3545

Hi Paul,

I am working Sunday. I work 12 hour shifts on the weekend so that means 14-15 hour work days. I just can't squeeze much play time in between shifts. I have available the 14th or 15th, or 22nd or 23rd. Please call me sometime after 9pm tonight at 739-1111 so we can get this figured out. I will be sleeping this afternoon for work so please wait until after 9pm to call if you can. If you can not call tonight you can call after 7pm Saturday or Sunday.

The camera will have to be mounted on a side adjacent to the side the antenna is mounted to. I have engineered my capsule to have the APRS antenna mounted opposite my control panel. The other two quads are available for mounting other external antennas or fixtures. The side with the APRS antenna is the internal mounting point for board mounted experiments. It sounds like it will be quite simple to mount your existing quad assembly onto my capsule. I will need to make sure that it seals adequately as my capsule is designed to have minimal air transfer between the outside enviroment and the capsule interior. I assume that there will be an umbilical running from it to your capsule for the control?

Also, it was discussed at the last meeting that I could attend, to have my capsule on top due to my capsule having straps that run completely under my capsule from the load line attachment points. This was to reduce the chance of a tear-away failure like occurred on the TV0B flight. Did this idea change? Did you change your capsule to also have the attachment points in a sling arrangement? Or???????

I like the ideas for the photos, they sound interesting. It would be great to have some sponsor's logo on the bottom of your capsule for fund raising purposes (hint, hint). I want to make sure and get a good pre-launch photo of my capsule as I am going to send it to the Lakers to see what, if any, response I can get from their organization. You never know! I would like to eventually get an in-flight photo for the same reason but I have not solved that problem yet.

I'll be looking forward to your call.

> capsule interior.

Stephanie,

I hope you are aware that every ounce (almost) of air will be *removed* when your payload rises into the near vacuum at high altitudes, and conversely *all new air* will enter your capsule on its way down into the normal surface pressure environment.

You can seal against "drafts" entering your capsule at low altitudes, but that's about it. The air transfer will eventually be 100% no matter what you do (short of a pressure vessel).

Paul, when do you need them to be moved? I have a tow hitch on my truck. I am free on Saturday, then not again until next Thursday.
About the parachute fabric, Stephanie has it right now.....maybe she can bring it in to the meeting tonight if she can?
Mike KC7DPD

From: n1ltv
Topic: 3540 Message: 3549

Mike,

Thank you again for taking the great pictures in the first
place, and then posting them.

The yahoo thing is just a
little glitch. I had a heck of a time just getting registered
on these lists in the first place due to the fact that I'd
been a geocities website client for years and then yahoo bought
geocities, so geocities records and registrations were all mixed up
with yahoo stuff. That was a giant mess.

A few pictures are so superior to tons of words,
and this armchair western adventurer now has
a real good idea of what Bully Creek looks like.

On that photo gallery page I cropped and expanded
your Artic capsule studio shot to get a closer look,
but unfortunately the images you prepared
correctly with low resolution for web display do not
expand very well before going to pieces.

If you could send a moderate resolution (100k to
400 kbytes) to me, I could get a nice closeup out of
it.

n1ltv@... for anything over 20k bytes

Or if you could do that I'd appreciate it. A
full frame of nothing but capsule is what I'd like.
to get.

Hank

Forgot the part about the non-constant density.

3552. Re: [tvnsp] TVNSP 02D pictures posted on web for easy viewing

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-09 20:54:19 UTC
From: Jeff Melanson
Topic: 3540 Message: 3552

Hi All,

Here is the link to the TV02D pictures that Hank has posted
for us.

http://www.geocities.com/n1ltv/tv02d.htm

I have already described most of the pictures but there is
one new one of the inside of the capsule.

In the upper left hand corner is the GPS35. Just under that
is a battery holder. It holds 4 AA 1700 mah batteries and is
the power supply for the GPS35.
The second battery holder is identical to the first one and
supplies the Alinco radio and the Tiny Track II. The long
silver looking item is the Tiny Track II wrapped in an
anti-static bag. No these bags are not conductive and won't
short anything out but do protect from static electricity.
The button in the middle with the yellow tab attached is the
thermochron. On the right is the Alinco DJ-S11 radio. On the
far right you can see the antenna connection. All this is
sitting in foam rubber that was cut out to the right shapes.
There is another block of foam rubber that goes on top of
all this and then the lid is closed and zipped shut.
The battery boxes have an on/off switch built in. After I
slide the switch to the on position I put a piece of tape
over them to make sure they can't turn off.

Jeff,

Thanks for this description. I'd never have guessed what
that was, but I was sure wondering!

Let's get the flight and capsule information flowing at
TVNSP for the benefit of all who read this list, many
of whom have not been at meetings or launches.

3556. Re: [tvnsp] Re: Stephanie's Capsule

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-09 21:19:29 UTC
From: Stephanie Steele
Topic: 3452 Message: 3556

I understand that. I have designed my capsule to allow one complete (nearly so anyway) air exchange during the assent/descent cycle and not to 'breath' continuously as a 'loose' capsule will do. That is what I meant by 'minimal' air transfer. My theory is this, the outward venting of pressure during assent is of minimal concern to the environment of the capsule payload(s) including the batteries. The inward venting of pressure during descent is of significant concern as that air will be cold and will negatively effect available battery voltage. By controlling this as much as possible the pressure equalization that occurs on descent will be a single event that's effect on the batteries should be minimized by the design of the battery storage compartment, heat sink, insulation and the batteries positional relationship to the one heat producing item in the capsule, the GPS.

See, I do think before I act!

;-)

Temperature in capsule recorded every minute by microelectronic
miracle Thermochron device smaller in diameter than a quarter.

The log part of the record is the main thing. Log section below
is close to the 10:51 AM MDT takeoff time. Temperature
attained by battery power expended and maybe sun exposure
heats the capsule interior to over 100 F before it leaves the
ground.

Just about that 10:51 liftoff time the interior temperature
starts to decrease.

This all needs to be graphed.

Hank

[Time/Date Temperature] (Fahrenheit)

08/03/2002 10:49 , 101.3°F
08/03/2002 10:50 , 101.3°F
08/03/2002 10:51 , 101.3°F
08/03/2002 10:52 , 100.4°F
08/03/2002 10:53 , 99.5°F
08/03/2002 10:54 , 98.6°F
08/03/2002 10:55 , 97.7°F
08/03/2002 10:56 , 96.8°F
08/03/2002 10:57 , 95.9°F
08/03/2002 10:58 , 95.0°F
08/03/2002 10:59 , 94.1°F
08/03/2002 11:00 , 93.2°F

Paul,

It was my understanding that you would be making a graph of
the thermochron data and posting it. Are you still working
on that?

Sounds pretty good.

Your radio produces some heat I would think, though less
than the GPS since it only transmits intermittently.
The batteries also generate a tiny amount of heat.

Jeff,

I'm disappointed that the Thermochron viewer software appears to need a valid Thermochron port enabled for the software to work.

I could have gotten a quick graph that way.

Hank

Hank,

I have noticed that the GPS35 is very warm to the touch when
I power up the capsule for a while. It is significantly
warmer than any other components I've flown (which isn't
many). I have not noticed this with the radio and batteries
but I'm sure they must add a little heat.

Hank,

I agree. Perhaps someone who is proficient with EXCEL could
do it. I'm afraid that doesn't describe me. It would be nice
to show temperature versus flight time and perhaps some
references to altitude.

> many).

Jeff,

This is because the entire power consumption of the GPS
goes to heat and that it runs all the time.

> I have not noticed this with the radio and batteries
> but I'm sure they must add a little heat.

A good part of the transmit power of the radio (maybe
30%) leaves the capsule and is dispersed in the
universe as RF power.

Most of the battery power developed is electricity which
is not dissipated as heat *in* the battery but rather heat
in the above two items, so the *internal* battery heat is
minor, but it is there because no battery is 100% efficient.

Kind of a theoretical principle that's nice to be aware of.
Nature pays attention to every bit of heat and other types
of energy and it's all accounted for. :)

Hank

I've started the longer process to plot, but I'm signing
off the computer.

The Thermochron software only does
Thermochron data, so it could eat that whole log file
in one bite and graph it without any human intervening
to format the data, which is what Excel and anything else
will need to have done.

3569. Test of Three-peat One

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-10 01:09:24 UTC
From: Stephanie Steele
Topic: 3569 Message: 3569

BTW, for those 'unfortunate' souls who missed it, I did a test to failure yesterday with my capsule in flight configuration. You might have seen it zooming around the Treasure Valley at a near constant altitude. With fresh alkaline batteries it ran for just over 20 hours before running out of power. In checking the log I observed no problems in the data during the entire test. Flight batteries will be Lithium of course.

For those inquiring minds.....

Not right now. I lost my frame relay connection to the office where
that program was located, and I can't run servers over my new cable
modem connection. (The price is much better though.) I will have to
transfer the program to another machine. When I do it will be located at:

http://aprs.rickwidmer.com

If I haven't told you it is running again within a week bug me again.

Rick

Oh, I just thought of something. You have an open bed truck. The mirrors are in mounts that are 6' across and 9" deep. We may be able to move them in the back of your truck and not have to rent a trailer. Can you move them over the Labor Day weekend?

3577. Canon Elph modifications

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-11 20:30:20 UTC
From: Mark Conner
Topic: 3577 Message: 3577

Hi,

Can someone on the list tell me which solder pads to work with to modify a Canon Elph LT for electronic shutter control? I checked Bill's pictures on the TVNSP area, but they aren't quite clear enough to tell what to hook up, and this page http://www.pixelgate.net/~deepdiver/camera.html gives no specifics. Bill's old web page may have had the specifics, but it's no longer available. It appears the camera won't operate w/o film in it, and I'm not (quite) ready to waste a roll of film on testing.

My understanding is that two pads need to be shorted to a third to trip the shutter. Anyone know which pads?

From: Bill All N3KKM
Topic: 3577 Message: 3578

Looking at the top of the shutter button with the front of the camer facing you, the pads on the lower left and lower right (as you are looking down) are the ones that I shorted together, but I did it with individual wires and shorted them together at the plug end (a three pin Deans Connector). The common,or ground, pad is the upper left. The lower left and right pads were shorted together to get the camera to do its automatic focusing thing and then trip the shutter. There was never a problem with the two shorted together. The camera shutter button is a two step button and pushing it halfway enabled the autofocus, and pressing it further tripped the shutter.

Mark I did not remember the part about it needing film to work. I'm sure that I had done my testing without film.
By the way - On the opposite side of the camera is the flash capacitor. STAY AWAY from that end of the camera!

We're doing well here in Greenville NC. Enjoying many more weekends with family. Sorry that I missed the Great Plains Super Launch. Sounds like you guys had a great time and nice attendance.

I have a plot of the data but not sure how to get it
out to the group. I may send it to Hank and Stephanie
and let them post it out.

Thanks, John. I received the spreadsheet file but I've such an old version of Excel that it won't take this so I'm not able to see what you have.

The xls file can be emailed to the list as an attachment, or could be uploaded to the TVNSP file area.

I usually like to make gif picture files of all this kind of stuff so that it's never a problem to see it, but that method has the disadvantage of not distributing the basic data so others could work on it if they had Excel or other special software such as Street Atlas for the SA map files.

Hank

3586. TV02E Config

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-15 21:01:29 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3586 Message: 3586
Attachments: 2 described; binary payloads are missing from this source WARC

I've put together a first draft documenting the configuration for my
TV02E capsule. Please take a look and make recommendations.
I'd like to do these for each flight. They can be put into our
webpage along with data from the flights.

In addition, if we're willing to pay for the copies, we can create a file
for everyone about the flight. Photogtaphs, graphs, flight code, etc
could be included. At the next meeting I'll show one of my flight
files.

Paul

I think the idea to create a file for each flight is great but I would
suggest creating it in Adobe Acrobat and then distributing it as a PDF
to those interested.

From: n1ltv
Topic: 3595 Message: 3595

In a rare instance for me for expensive commercial software, I also have the full Adobe Acrobat software.

I got a super deal on a slightly outdated version.

3596. TV 02D "volunteer" webpage

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-16 18:23:06 UTC
From: n1ltv
Topic: 3596 Message: 3596

I guess I'll expand that temporary webpage I did
that at first just contained Mike's pictures of 02D.

I'll be adding some of the various maps, files,
and graphs that have been produced.

Getting the material generated by a flight on a
webpage within a week or two after the flight
shouldn't be too hard for TVNSP to do.

Hank

Hank,

I am in the process of building the TVNSP website as we speak. Thank you for your efforts so far to get the information about the latest flight onto the web, but I would like to concentrate the efforts towards one website. TVNSP has been hosted, and I am doing some layout changes and gathering pictures for it right now. I will be announcing the "official" opening of www.tvnsp.org within two weeks. I lost alot of work when my computer crashed and it has been a considerable effort to get back to a point where I can work on the website. Again, thanks for your help in getting information out on the web, but when I get TVNSP going, I would like to see it all on one site.

> I guess I'll expand that temporary webpage I did
> that at first just contained Mike's pictures of 02D.

Sorry for not emphasizing the word *temporary*.

This *02D limited* webpage is only a *stopgap* until the real TVNSP webpage comes into existence updated or the existing one is updated. Then the idea was that the temporary 02D one will evaporate. That's what I meant by temporary.

It could even be of some help to Mike as one place where some of the material already generated could be downloaded.

I've emailed Mike offlist with a more detailed email on this general subject. The intent was to create the first web accessible (without yahoo restrictions) TVNSP flight information in about a year if I'm not mistaken.

Hank

These are questions that try men's minds. I was wondering the same things! I guess someone who know how should start running some predicitions so we can begin to formulate some plans. All I know is we are going for 95k with unknown ascent and descent rates. We could start using a landing site in the New Plymouth area. This would be good for winds out of the NW. Try using 43 58.007 / 116 50.018 for starters. I'll try and see what I can come up with but I don't have any confidence in my calculations.

From: Jeff Melanson
Topic: 3538 Message: 3602

Hi all,

Below is a copy of an email I sent some time back (Aug. 5th). It is a starting point. What we really need to know is the actual weight of the total payload to make better prediction. At the time that I sent this previous email Paul and I believed 10 pounds would be close. As far as a launch point goes let's so the same thing I did with my flight. Let's look at safe landing area's and then choose a launch point that will take us there. Keep in mind what we've talked about before which is staying away from things that tend to attract space capsules like a magnet!

Try your hand at Liftwin and see if you get the same results I did. Try varying the weight and see what happens.

TVNSP,

Aug 24th Flight.

This flight will be Paul and Stephanie's capsule's. Paul's capsule will have a tracker and a geiger counter. Stephanies capsule will have a tracker and a camera.

Total payload weight will be 10 pounds.
The balloon is a Kaymont 1500 gram.
Burst Altitude is 93,000 feet.
Ascent rate is 950 fpm.
Descent rate is 1200 fpm.
Free Lift will be 3.5 lbs.
Nozzle lift will be 13.5 lbs.
Time to Burst is 1.6 hrs.
Initial balloon diameter is 8.1 ft.
Burst diameter is 31 ft.

Hello Balloon Chasers,

I know quite a few of you got in on the Garmin GPS 35 deal through Stephanie Steele (KC7DBA). If you download the pdf files from the Garmin site that pertain to this series of models you'll see where they show a "magent mount" option. I actually fabricated one of these out of a vinyl magnet sheet I happened to come across a few years ago. It really works great. It hangs on to vehicle roofs at highway speeds and the soft vinyl magnet material won't mar the surface. The sheet is just slightly thicker than the heads of the countersunk M3 screws, so only the vinyl magnet pad touches the surface you stick this to. The screw heads are completely recessed.

Now I'd like to build a few more of these mag mounts. Trouble is, I can't seem to find vinyl magnet sheets of sufficient thickness. I've come up with some designs that use thinner sheets or different magnets, but I'm not ready to go there yet.

So I have two questions for the group:

1) Does anyone have a good source for vinyl magnet sheets approximately 0.075" thick that can be cut to 2.225 inches wide and 3.792" long? I've been corresponding with one company where their web site says they can supply this material, but the customer service people say they can't.

2) If I find a source for this material, how many of you would like some, and how many would you like? Hopefully they won't cost more than a buck or two each.

Thanks.

Best regards,

Tony

Tony,

Any sign shop that does magnetic signs should have the stuff in stock. I
ll check with the shop here in Emmett.

Tim

Hello Balloon Chasers,

I know quite a few of you got in on the Garmin GPS 35 deal through
Stephanie Steele (KC7DBA). If you download the pdf files from the Garmin
site that pertain to this series of models you'll see where they show a
"magent mount" option. I actually fabricated one of these out of a vinyl
magnet sheet I happened to come across a few years ago. It really works
great. It hangs on to vehicle roofs at highway speeds and the soft vinyl
magnet material won't mar the surface. The sheet is just slightly thicker
than the heads of the countersunk M3 screws, so only the vinyl magnet pad
touches the surface you stick this to. The screw heads are completely
recessed.

Now I'd like to build a few more of these mag mounts. Trouble is, I can't
seem to find vinyl magnet sheets of sufficient thickness. I've come up
with some designs that use thinner sheets or different magnets, but I'm not
ready to go there yet.

So I have two questions for the group:

1) Does anyone have a good source for vinyl magnet sheets approximately
0.075" thick that can be cut to 2.225 inches wide and 3.792" long? I've
been corresponding with one company where their web site says they can
supply this material, but the customer service people say they can't.

2) If I find a source for this material, how many of you would like some,
and how many would you like? Hopefully they won't cost more than a buck or
two each.

Thanks.

Best regards,

Tony

Hi Jeff,

Did you try using the lat/lon that I suggested for the landing site? If so, where does this put the launch? This puts the landing just west of New Plymouth. It's a little further south and west than what we have used in the past which should reduce the chance of ending up on squaw butte. The area south of I-84 is all open BLM ground with good access if the track drifts outside the valley.

For some reason I can not get the lat/lon information to import into street atlas. I came up with some numbers in balloon track but they don't match yours. Somehow that does not surprise me!

I will weigh my capsule and send out my weight. Paul said that we would not weigh them until the pre-flight meeting. I know he was shooting for 10 pounds but I would like to get some accurate weights for you all to work with. Paul, why don't you weigh your's and they can add the weight to mine. My weight will be my capsule and the link lines. Pauls will be everything else.

Although the total weight only needs to affect the descent
speed (the free lift governs the ascent speed, so that can
be adjusted by amount of helium fill), it's really
nice to make an effort to have these weights about a week
before liftoff.

Thanks to Stephanie, Jeff, and John for getting this process
started a suitable time in advance. The upper winds prediction
should get fairly accurate around Wednesday, but this is not
too early to get a few rough estimates.

As was done with 02D, let's disclose what vital statistics
we're using for predictions.

Hank

Hmmm

I came up with:
Bearing: 109 deg
Randge: 67 mi

Not good from New Plymouth ;(
Back to the drawing board ;-)

From: n1ltv
Topic: 3610 Message: 3610

As an example of the vital information that makes a
difference, here's what I used for 02D. The altitudes
don't make too much difference so don't worry about exact
figures. This is from Friday, August 2 on this list:

BT version 1.71

Balloon variables: 1000 up 1400 down 47k peak

Site variables: Launch alt. 3150 feet Landing alt. 3000 feet

WX variables: ETA model +21 hours Location BOI
Time 1500 UTC Saturday

I could use TWO Tony.
I can check my sources at work monday.

BTW,i have such a magnet on my old factory
Garmin external antenna and it worked great.
They were proud of it 7 or 8 years ago. $169
Used it on my old Garmin 40 antique ;-)
The gps would go to sleep without its additional
help outside the vehicle.

Randy,

This is too huge a difference to be using the same inputs. Unless people agree on inputs this posting of various predictions is pretty much a waste of time.

I know
That is what i am trying to figure out.
I'm apparently using the wrong sounding
data.
I used the same ascent,descent rates as Jeff.
Trying a different model next.

Jeff,

As expected, I get the same thing as you do (well, actually 355,42 but that little difference is insignificant at 7 days ahead).

Will post vital statistics form in a minute.

3619. Used Computers

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-17 18:43:17 UTC
From: Tony Barrett
Topic: 3619 Message: 3619
Attachments: 1 described; binary payloads are missing from this source WARC

Hello everyone,

I received the message below and a couple of phone calls from Russ Dunn, N7SMA. Russ works at Simplot Transportation and it looks like he's authorized to dispose of some used computer equipment. Looks like most of it is running Windows 95, though it appears the CD drives have been removed from most units. Some of the units have some decent sized (1 to 6 GB?) hard drives in them. I suspect you can pick these PCs up for $25 to $50 each, but that's just my guess.

Anyone have any suggestions about the best thing to do with gear like this? Should Simplot donate it to a school or the Boys & Girls Club or some senior center? Some of these machines wouldn't be too bad for Packet or APRS, though they are desktop / tower units.

If you have an interest in purchasing any of this equipment, or any suggestions for Russ, please e-mail him at the address above.

For those of you that don't have the latest version of Excel I've copied in a text version of his list below. It probably looks best when viewed with the right font. I think I used Arial 12.

Feel free to distribute this information on other mailing lists (John Cline, Doug Rich) if you think others might be interested.

FYI, I'm not getting a penny out of this. Just passing the word to "save the earth" (reduce, RE-USE, recycle).

Best regards,

Tony

Randy,

Are you using the current weather data or forecast data?

Hi all,

Stephanie brings up a new discussion point. Can you place a
landing site in Balloon Track and come up with launch site
coordinates? If somwone knows how to do this please post the
instructions. I see in Balloon Track there is a place to
enter the landing site coordinates but I haven't figured out
what to do next.

Hi Group,

When someone has time, could they please post a "do this then do this then do this" instruction set, including URLs, for getting the correct weather data, importing it into whatever software we should be using, and then importing it into street atlas, to assist me (and others) in making these calculations. I really hate being behind the curve here. I think I have the basic idea but I am having some problems and am not getting the same numbers as others. Thanks!

I have been playing with the 'forced site selector' and 'reverse calculator' functions as they are the apparent way to do this but I am unsure if I am on track prior to getting to that point.

3627. Interesting Results

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-17 19:28:12 UTC
From: Stephanie Steele
Topic: 3627 Message: 3627

Hi,

I just might have stumbled into the way to do this. I opened the weather data that I downloaded at midnight last night from UWy and ran a 'flight synopsis' on it on the main screen, then I went to reverse calculator and calculated the launch point based upon landing coordinates of 43.96861/-116.83833 and obtained a launch point just south of Ironside, Oregon which is where my manual calculations put it.

Hi Stephanie,

I'm short on time right now however I will do it later if no
one else has. I did post some instructions on how to get
forecasted data during our discussions of the last flight.
Someone please find that and repost it. We will start with
that and then continue bringing you up to speed. Tell me a
little about what you know now. Do you know how to use
current data to make a prediction?

I just re-ran the same calculation using weather from noon today and got
a landing point about 18 miles ssw of Ironside, Oregon.

Proposed landing site : 43.96861/-116.86833

Predicted launch site: 44.088284036/-118.1315299

Anyone else come up with this same information?

Stephanie

Stephanie,

Send me your phone number off list. I'll give you some quick
information on predictions.

If I got you lat/lon correct you chose a landing site 10
miles west of Cambridge. Using forecast data our launch site
would be about 1/2 mile west of New Plymouth.

No, landing should be near the intersection of SW 2nd Ave & Denver Road
just outside New Plymouth, this puts launch ssw of Ironside, Oregon.

****

Friends are quiet angels who lift us to our feet when our wings have
trouble remembering how to fly.

****

"They that can give up essential liberty to obtain a little temporary
safety deserve neither liberty nor safety."

Benjamin Franklin (1706-1790), Letter to Josiah Quincy, Sept. 11, 1773.

"Those who desire to give up freedom in order to gain security will not
have, nor do they deserve, either one."

President Thomas Jefferson.
1743-1826

3635. How to do a prediction with *predicted weather*

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-17 20:23:37 UTC
From: n1ltv
Topic: 3603 Message: 3635

Stephanie wrote:

> Hi Group,
>
> When someone has time, could they please post a "do this then
> do this then do this" instruction set, including URLs, for getting
> the correct weather data,

This has all been gone over right on this list.

Do I save all this TVNSP email?
No.

Do I use the yahoogroups search archives facilty?
Yes. http://www.yahoogroups.com

Please remember everyone. No current wind/weather predictions
until DAY OF LAUNCH or at most 12 hours ahead of time.

Hank

Here is Jeff's July 29 TVNSP posting on this subject:

Flight predictions with forecast winds.

Click on this link:

http://gus.arlhq.noaa.gov/ready/cmet.html

Scroll down to

Forecast Soundings

It's on the left side of the screen. Just to the right of
this is a pull down menu that says

----Choose a Forecast Dataset----

Pull down the menu and select

Medium Range Forecast Model (MRF 191 km over Globe)

Type in our 3 letter ID which is boi or go to the bottom of
the page and enter in the Lat/Lon of the launch site. Click
on the Next button.

Near the top of the page select

Text listing only

Use the pull down menu to choose the time to plot. For our upcoming launch choose

August 03, 2002 at 12 UTC (+___ Hrs)

Go to the bottom of the screen and click on Request Plot.

Cut and paste this entire page into Notepad and save the file. Put this into Balloon Track just like we have always done and there you have it!

Mark Conner says within 84 hours you can use the AVN model, and within 48-60 hours you can use the Eta model.

Now you know how to do it so get crackin!

Jeff

Duh
I was using this mornings data.
Thought we were flying today ;-)
Will try another predictions again when i have more time.

I think i have figured out how to do this.
I played with it a couple of weeks ago and it
seemed to work. Just nevere got back to it.
Try the "Calculator" tab. Then use the "Reverse Calculator"
Fill in the boxes and calculate.

3638. Launch site location for a predicted range and bearing

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-17 20:59:07 UTC
From: Hank Riley
Topic: 3638 Message: 3638
Attachments: 1 described; binary payloads are missing from this source WARC

This is the spot that has New Plymouth at a range of 42
miles and 355 degrees bearing.

I'd suggest using paper maps until next Wednesday. Most
times it's easier to shift around potential launch and
landing sites with pencil lines on a paper map.

Hank

3639. NWAPRS Summer Gathering Plans

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-18 14:41:50 UTC
From: Stephanie Steele
Topic: 3639 Message: 3639

A quick followup tonight for those planning/thinking about coming to the SG Sept 6-8 at the VaLLLey Camp in North Bend, WA

The nwaprs.org web pages have been updated and have many details about the annual event.

Last year we had a special presentation on APRS ballooning. So far I haven't come up with a central theme or focus for this year's meeting, however, I'm wondering if there's something we can do with APRS to help out a local jurisdiction in the event of a missing or kidnapped child, similar to the AMBER ALERT program in California and other states. Washington's program should be ready to kick off operation in October, according to a news report on Seattle TV last night. I don't have any info on what Oregon, Idaho, or Montana are doing, or if any similar program is underway in Canada.

I believe we can help the police by providing additional eyes and ears. We may be able to accomplish this with or without the capabilities of APRS.

How about sharing your thoughts on how we might be helpful to law enforcement should such an emergency occur in our region.

We're four weeks away from the Summer Gathering. If you plan on attending, which I hope you will, please remember to get your RSVP to Thom/K7FZO at mailto:tmproehl@....

Thanks, Dave

3640. Flight Predictions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-18 15:17:11 UTC
From: Stephanie Steele
Topic: 2381 Message: 3640

Running Saturday's forcasted data this AM I come up with a 125 minute flight bearing 356.1 degrees and 40.9 miles range. I am using a landing site of 44.13583/-117.12333 to give us a safe landing site with these winds. This puts the launch site in the Succor Creek area at 43.545/-117.0677

I think I got it right!?

We're using a 1500 gram balloon and lofting about 9 pounds of capsule
and one pound of 'chute. If we add three PPL, then I'd estimate
we'll reach over 90,000 feet with an ascent rate of 1000 feet.
Descent should be around 1200 fpm.

Someone want to check my swag?

Paul

Liftwin says 5 pounds of freelift for that ascent speed.

02D was way, way off for ascent speed. Jeff's balloon rose
a lot faster than expected (for unknown reasons).

However, for this general size balloon that has been used more
often I'd think at least 4 pounds for 1000 fpm (3 pounds will
supposedly yield 800 feet/min.)

> site with these winds. This puts the launch site in the Succor Creek
> area at 43.545/-117.0677
>
> I think I got it right!?

Yes, that's all correct. The degree of precision you're
carrying is unwarranted, but that's okay just for the purpose
of checking your method.

As of today the predicted landing has already swung to the east
about 18 miles! The range hasn't changed much but the bearing
sure did.

Ths far ahead it's remarkable that a computer can tell us
even this much.

By midweek it should become more certain what's going to
happen Saturday as far as winds. Then there still is the
uncertainty about the balloon behavior with respect to
it running either long or short.

Notice that the 02D error was mostly due to that balloon
running *way* long.

Paul,

We have run the numbers through Liftwin and have the
following:

Total payload weight will be 10 pounds.
The balloon is a Kaymont 1500 gram.
Burst Altitude is 93,000 feet.
Ascent rate is 950 fpm.
Descent rate is 1200 fpm.
Free Lift will be 3.5 lbs.
Nozzle lift will be 13.5 lbs.
Time to Burst is 1.6 hrs.
Initial balloon diameter is 8.1 ft.
Burst diameter is 31 ft.

The descent rate comes from your estimate of the parachute
performance.
This data is what we have been basing our predictions on. Do
you expect any changes?

John and interested others,

You might want to check this webpage since it has a
lot of information on the fees and regulations regarding
Idaho state park camping:

http://www.idahoparks.org/parks/parks-atoz.html#fees

If strictly enforced, a few of the rules seem to be
relevant to campspace sharing and may be somewhat
restrictive.

No.
I'll weigh my capsule tonight and get a more accurate number for
the group.

We'll be adding two thermochrons to Stephanie's capsule. I'll bring
one of them.

3658. Temp/humidity sensor and BS2 code

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-20 01:36:41 UTC
From: Mark Conner
Topic: 3658 Message: 3658

A while back on the Stamp list I saw a post regarding this sensor:

http://www.sensirion.com/en/sensors/humidity/sht11/default.htm

This is a SMD device, but there is supposed to be one coming 3Q or 4Q 2002 that has leads on it. I can't find the link to that at the moment on the sensirion site, but here's one for a distributor:

http://www.onsetcomp.com/Products/Product_Pages/Tattletale_pages/sensirion.html

Cost is $17-$20 in single quantities, about a 10% discount for 10-24. Free samples can be had on request at the sensirion web site.

I didn't follow up on it at the time because I didn't want to puzzle out how to read it with a BS2. But, the author below has gone to that trouble.

Main limitation I see is that it only goes to -40C (unknown whether the digital data bottoms out at -40 or whether the accuracy is out of limits at -40). But looks like a nice way to measure temp and RH. I wanted to capture this info to the lists so I can find it again in the future (and to see if others are interested).

From: Tracy Allen
Subject: Re: Humidity & Temperature Sensmitter SHT11 (-75)

For the record, here is another program that services the sht11 or sht15. It's a little shorter than Steve's, because it ignores the CRC calculation, and it uses shiftout and shiftin instead of bit banging. So, different ways to do the same thing. By the way, Steve, thanks for turning me on to this Sensirion chip. It is very sensitive and a marvel of engineering.

Everyone,

We are getting the TVNSP website setup with a section to email individual people in the group if needed. I would like to know who would like to have their email address on the website. Let me know if you want it on there or not.....

Also, I would like to have a section with everyone's individual picture on the website, if that is ok with everyone. If not, then again let me know.

I think everyone will be impressed with what my girlfriend Andrea has accomplished on the design and "look" of the website. We are always open to suggestions on how to improve upon it if there is something you want to see or not see online.

Just a disclaimer, if you go to www.tvnsp.org today, this is NOT what the final version will look like, I have been experimenting with different things and right now it is just the carnage from all of that!

I did look at the existing angelfire web site. Please get it off angelfire as soon as possible! Popup adds suck, as does the barrage of cookies they try to set when you hit the page. If you need help, let me know, I've done a few web sites.

One suggestion, don't bother with a form to send email to people, just present a MAILTO: link. I'd much rather compose email in my own preferred mail application than a textarea on a form.

Feel free to email me direct if there is anything I can do to help.

It looks like you'll be in a region where the winds aloft could change rapidly in a few hours. I would suggest running predictions using winds valid + and - 12 hours from launch time to get a feel for that.

Later launches and a more southerly launch site should produce landings more to the east. Earlier and more to the north will give you landings more to the north. That can all change by Saturday, but it explains the radical changes you might be seeing.

- Mark

I just talked to Paul, his capsule also weighs 5.2 pounds.
Add 1 pound for the parachute and we have a total weight of
11.4 pounds.

Using Liftwin...
Balloon type 1500 gm
Site Conditions:
Alt 2500 ft
Temp 60
Results for an ascent speed of 970 fpm...
Free Lift 3.9 pounds
Nozzle lift 15.3 pounds
Peak Altitude 90,000 ft.
Time to Burst 1.5 hours.

3683. Saturday's Flight

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-21 02:48:10 UTC
From: Jeff Melanson
Topic: 3683 Message: 3683

Hi all,

I spoke to Paul on the phone and told him Mark's evaluation of the predicted weather. I also told him John and Randy noted winds at sunrise. Paul suggests that if the prediction continues to be uncertain we might want to delay the launch until later in the morning to get the best possible prediction for that morning. This might be a good idea for safety reasons. Last year is when one of our flights ended up in a power line due to lack of good information. If we do this then we will need to have a place to meet again like we did for the last flight with internet access. Since it looks like were interested in Randy and Stephanies area for this flight would one of you be interested in hosting a morning prelaunch meeting if needed?

As you look at the predictions for Saturday don't forget to look at the MRF and see what's happening in that time frame. Currently you can see that the eastern edge of a LOW is predicted to be right over us.

From: Jeff Melanson
Topic: 3684 Message: 3684

I just reran the prediction using the new burst altitude.

BT version 1.77

Balloon variables: 970 up 1200 down 90k peak

Site variables: Launch alt. 2800 feet Landing alt. 2800
feet

WX variables: MRF model Location BOI

Time August 24, 1200 UTC

Results:
Range 24.3 miles
Bearing 5.8 degrees

Not much of a change.

No problem with the pre-flight get together. We can do it at Fruitland City Hall if there is too large a group to invade Randy's place. I have balloon track installed on my work computer. Two visitors will overload my little place ;-)

Right Paul?

From: John Knapp
Topic: 3683 Message: 3688

With the eastern edge of the low over us, the path of the balloon is basically due north. Do we want to launch at Bully Creek, or should be consider Murphy or Succor Creek?

For the meeting Friday night, will someone have a laptop with them so we can run predictions from different launch sites? or should we say we want to land at point A and go from there?

Things to think about. If I get my laptop updated I will bring it to the meeting but I hope there is another on there also.

3690. Prediction tips

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-21 15:10:30 UTC
From: n9xtn@cox.net
Topic: 3690 Message: 3690

As you get close enough to launch to use the Eta model, be sure you extract winds valid for the actual launch site coordinates. The Eta resolution is 40 km, while the MRF/AVN resolution is 191 km.

For MRF/AVN work, it's probably OK to use BOI as the requested data location for any launch site within 100 mi of there, but for the Eta you should use the actual launch site lat/lon to at least 0.1 degree precision. With the wind flow predicted for Saturday, a few tens of miles may make a lot of difference in your results from the Eta.

Also, don't be too surprised if the actual track ends up a lot different than the prediction in this particular case. You could go north, or you could go east, or somewhere in between. Given that you have a lot of no-fly/no-land areas, you may wish to postpone to Sunday when the track predictability is much better. If Saturday's forecast indicates you're still in this transition zone when you get together Friday evening, give strong consideration to not flying Saturday.

With the weather in such flux I am getting the idea that any planning at this point is fruitless. My calculations show the Bully Creek Launch site as a no-go for Saturday based upon this morning's data. A launch site slightly east of Juntura would put us down in the New Plymouth area based on this morning's data.

I have been checking at least once a day for the last 4 days and things are moving a bunch. Hopefully a trend will develop soon.

3692. Forecast instability will likely not abate; suggest postponing 02E

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-21 16:08:51 UTC
From: n1ltv
Topic: 3692 Message: 3692

I'm preparing to upload graphics that show in pictures
why the predictions are so variable and why they
will *not* stop being that way right up to launchtime.

Being a non-Idahoan I hesitated to state the following
thought, but I'm emboldened by Mark having brought it up.

I suggest launching at another time because I feel it
will be almost impossible to know where this balloon
will land given the tight circulation of upper level
winds existing in Oregon/Idaho Friday and Saturday.

Given the large areas of near impossible retreival
landing zones in the rugged, roadless wild areas of
the state, there is a high probability of never
seeing 02E again if launched anytime Saturday.

Standby for graphics.

Hank

There's a small chance the problem could abate for Saturday, but it's TVNSP's call if they're willing to wait until Friday to declare a postponement.

In marginal weather cases (either surface or aloft) I usually wait until the D-1 12Z models are in (about 17Z) and decide then. If everyone is prepped for the idea that there may be a postponement as late as the day before launch, then it's not difficult to make that no-go call that late. However, if the launch team would prefer not to have such late notice, then you're forced to make that decision earlier and possibly forego what might end up being a favorable day.

So I'll disagree a little with Hank and say you can wait until Friday to make that call if you want. It's likely to be the same answer, though.

Here are the graphics. Friday graphic included because the
circulation is a little more prominent, and to show that it's
not a fast changing feature (it may still be around Sunday).

I noted and posted this same kind of feature on an earlier
TVNSP launch, but the situation then was that the circulation
was present earlier in the week, and back then the day's
soundings were being used rather than the forecast soundings.

The effect then was the same in that each day brought a different
balloon track.

The overall situation was different from now in that the
circulation then had dissipated by launch day; in this case
it's in full force right through Saturday.

The computer is having trouble deciding the exact location of
the circulation, thus its predictions are varying fairly
wildly from day to day (high sensitivity to geographic position
because of a high wind field gradient).

I thought I was agreeing with Mark. :)

Oh yeah, that's right, Mark's a meteorologist. :)

Notice all my statements so far regarding a postponement
have had "likely" attached to them ..... just like a
meteorologist. :)

Of course, it's always up to TVNSP what to ultimately do.

Hank

3696. Re: Forecast instability will likely not abate; suggest postponing 02E

Yahoo group: tvnsp (2000 — 2002)

In the caption I said "will likely not abate"

in the text I said the following:

> I'm preparing to upload graphics that show in pictures
> why the predictions are so variable and why they
> will *not* stop being that way right up to launchtime.

With the word likely added before "*not* stop" as it
should have been typed, I see essentially no difference
between Mark's and my assesment.

Hank

I agree with Mark. And I'd like to add, even if there's uncertainity in a flight prediction, that's not necessarily a reason to hold the launch. We know it's going between north and east. We know the range is between 25 miles and 65 miles (or some such numbers). We'll have to look at the maps, but we may be able to find a launch site that gives us a wide lattitude or ranges and azimuths for a safe launch under these conditions.

Remember, not only is amateur near space amateur science, it's also an adventure.

Hi Stephanie,

I'm ROTHL!! (Rolling On The Floor Laughing!)

In all seriousness (that was hard to spell) I think we
should meet Friday night to make the final decision. Right
now I tend to lean toward a flight cancellation. While I
realize that it is an adventure I'm not willing to take
unnecessary risk even though the capsules aren't mine. It's
not fun watching your capsule hanging in wires or landing in
some dangerous area. Been there done that. Let's continue to
watch the forecast and see what develops.
Thanks Mark and Hank for the forecast evaluations. It's
definetly
helpful.

I thought it was funny, too.

> Thanks Mark and Hank for the forecast evaluations.

You're welcome.

My thanks to Mark for being a proponent of the use of forecast soundings to do balloon track predictions in the first place.

Just the fact that TVNSP is weighing this situation so carefully and wisely on a Wednesday shows great progress has been made and that TVNSP is maturing as a capable balloon organization.

Hank

3708. Idaho is not Kansas, Colorado, ...

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-22 01:10:04 UTC
From: n1ltv
Topic: 3708 Message: 3708

To me "suggest postponing" means to consider that action,
with no specification of a deadline to decide.

I never meant to imply doing anything today, or even
tomorrow. (More like noontime Friday or later at the meeting
just to pick a time so as not to be too vague.)

I also checked the use of abate, and although
a legal definition of the word is to disappear
entirely (as I was intending), the common use is "to
diminish." What I meant to convey was that the prediction
may well not converge as well as the ones did for TV 02D just
weeks ago due to the existence of the Oregon/Idaho swirl.

It may abate somewhat the closer we get to Saturday,
but the main point is that the swirl is contributing to
the oscillations of the MRF, and if the swirl is still
there Saturday, even with a fairly good model convergence
by Saturday, pegging the actual balloon track with even the
usual 7 - 15 mile accuracy may be improbable.

The bottom line is that Idaho is not Kansas or Colorado or
Oklahoma, etc. It is a more difficult state to do balloon
business in, probably the most difficult west of the
Mississippi, of the states in which amateur groups are active
currently. That's just reality.

NASA postpones rocket launches and real balloon scientists
postpone balloon launches. Earlier this year MABEL (Michigan)
postponed a launch (since it looked like it would go close to
or into a great lake) and had a perfectly wonderful launch a
week or so later.

EOSS postponed one of two launches just this last Saturday
due to high surface winds at launch, and launched another (NOAA
scientific) but suffered balloon damage and a semi-failed balloon
mission thought to be due to balloon damage at launch.

It's all a judgement call in the end. I like what Randy said
today:

We don't want it to be a reckless adventure either ;-)

From: Jeff Melanson
Topic: 3690 Message: 3710

Mark,

I have been thinking about your tips and have some
questions.

You suggest using the actual launch site coordinates for the
ETA model and that makes sense to me. What about the morning
prediction if we launch late? If we get the latest current
prediction from the Wyoming website what is the resolution
of that? No model has been built yet unless the ETA model is
immediately updated. That means the data is for one specific
spot. If we are 40 miles away then how good is that
information? I suppose that would depend on where we are in
the transition zone. I suspect that in this case the current
information may not be good for our launch location. This
would add more uncertainty to the prediction.

Does anyone know when the MRF and ETA models are updated?

>
> As you get close enough to launch to use the Eta model, be sure you extract winds valid for the actual launch site coordinates. The Eta resolution is 40 km, while the MRF/AVN resolution is 191 km.
>
> For MRF/AVN work, it's probably OK to use BOI as the requested data location for any launch site within 100 mi of there, but for the Eta you should use the actual launch site lat/lon to at least 0.1 degree precision. With the wind flow predicted for Saturday, a few tens of miles may make a lot of difference in your results from the Eta.
>
> Also, don't be too surprised if the actual track ends up a lot different than the prediction in this particular case. You could go north, or you could go east, or somewhere in between. Given that you have a lot of no-fly/no-land areas, you may wish to postpone to Sunday when the track predictability is much better. If Saturday's forecast indicates you're still in this transition zone when you get together Friday evening, give strong consideration to not flying Saturday.

3711. Prediction

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-22 08:02:51 UTC
From: Stephanie Steele
Topic: 516 Message: 3711

Hi all,

I just got home and did a prediction using the AVN Short Range data with Bull Creek as a launch site. I had the landing just southeast of New Plymouth in an ideal area. This was the most promising data I have seen yet.

3712. Re: [tvnsp] Prediction tips

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-22 15:02:06 UTC
From: Mark Conner
Topic: 3690 Message: 3712

I think you mean the "morning upper-air observation" from Boise, right? The UWyo website doesn't have forecasts that I know of.

If the situation Saturday morning is similar to what's been forecast, and you're a few tens of miles from Boise, the observation may not be representative of the winds 2-3 hours later at your launch site. I think a forecast from the 00Z or 06Z run of the Eta for your launch site location may be better than the 12Z BOI observation.

See this site for details on when model data is updated at the ARL web site:
http://gus.arlhq.noaa.gov/ready-bin/ops.pl

Also note this message from ARL:
READY users:

August 15, 2002

We at NOAA ARL introduced a higher resolution version of the AVN forecast data from NOAA NCEP into READY at the beginning of August. We are calling the dataset the "AVN Short Range" dataset, of which we will soon have an "AVN Long Range" dataset to replace the MRF dataset since the MRF was replaced by an extended range of the AVN at NOAA NCEP. This Short Range dataset is 3 hourly out to 84 hours with a horizontal resolution of about 95km and as of today (August 15) is replacing the AVN 111 and eventually also the AVN 191.

Glenn Rolph
NOAA ARL

So use the "AVN short range" now for <84 hours when you want "AVN" data, and eventually "AVN Long Range" will replace the MRF (it already has elsewhere within NOAA). If they take all of the feed (they may not due to space/bandwidth constraints), you can do long-range forecasts 4x/day.

From: verhap@occ1.sd01.k12.id.us
Topic: 3714 Message: 3714

I've added more details to the capsule configuration report. I'll make copies available to everyone at Friday's Flight Readiness Review. Stephanie, I need to know the following about your capsule.

What panels (camera, antenna boom ,etc) are located on which sides of your capsule? Do you label the sides of your capsule? (I'm using A, B, C, and D)

What BLTs and LTs have you programmed into your tracker? I think you're using a KPC 3+ and GPS35. Is that true? What HT are you using and what is it's output power?

Since you're not flying a flight computer, I assume that your tracker sends out the same data all the time. Is that true?

Thanks,
Paul

3716. Flight Prediction 1500 mst

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-22 21:08:14 UTC
From: Stephanie Steele
Topic: 3716 Message: 3716

Latest prediction shows a launch from Bully Creek puts the landing NW of Vale. Flight path is 97.8 degrees and 9.5 miles.

Landing: 44.0113/-117.2212

I am now using the AVN Short Range data calculated from Bully Creek's coordinates for these calculations. If this trend for a short flight continues (my definition of short is under 25 miles) then I can't see anything other than surface weather conditions that would prevent a launch on Saturday morning as planned. With a short flight we can move the launch point easily to a location that will allow a landing in a safe & reasonable location.

If anyone is inclined to verify my calculations and let me know if I'm off track here please feel free.

That strikes me as odd, having so shart a flight. A low pressure system usually has higher winds than a high pressure system. I would expect a longer flight with an approaching low. Guess I should look at the MRF.

At nine miles, we could place this flight in the record books.

Paul

Using the MRF data for 1200Z 24Aug02, I got the
following:

Bearing: 98.8 degrees
Range: 38.3 miles
Minutes: 129.3

Lat: 43.9431
Long: -1166491

Haven't had time to look at AVN or anything else.

The flight path heading has remained constant for the last 24 hours but
has progressively gotten shorter. From looking at the forecast the low
pressure cell that is effecting us now is supposed to pass through by
12z Saturday and leave us with the winds that make up this prediction.
The question is, will this indeed happen by Saturday?

TVNSP may be given 13 PCs. The donations would go through VOI so that Simplot can get a donation credit on their taxes, then move on to TVNSP. We should have permission to sell some of them for balloon money. I'd like to see TVNSP set a couple of them up for a Mission Control. We'd install software like, APRS +, Balloon Track, Liftwin, etc on the PCs and have students run through the entire process of predicting a flight and then watching it live. The classes we're teaching right now would be used to teach kids to be mission control (so don't lose your notes). Organizations like schools and scouts would get involved. Perhaps even adult organizations like the Lions Club would like to get involved with a flight.

We'd need to get TNCs, HTs, and antennas for Mission Control. John mentioned that there may be a way to use a sound card as a TNC. If so, we could save some money there. I think a scanner could be used in place of the HT, saving money again. We could make simple ground plane antennas and mount them on a simple mast.

We'll need someone with some free space (a garage?) to store mission control. It would probably be best if we purchased some plastic tubs to store the equipment in.

The balloon group, Windtrax, did something similiar several years ago and were very sucessful. I hope we could do the same thing in Idaho.

Paul

Using the AVN for 1200Z 24Aug02, have a little
different results:

Bearing: 91 degrees
Range 24 miles
Time: 123 minutes

I am curious how you came up with a range of 9.5
miles. Or has the information changed that much. Also,
since 1200 UTC is about 0500 local time, we might want
to use 1500 UTC. Any thoughts?

Has anyone heard from Mike? Mike, have you been able to pick up helium?

John, can you add the following to the check list? We need to measure the dew point at the launch site before launch. I'll bring a sling psychrometer to do this. In your checklist we'll need one blank spot to write down the dew point.

Paul

I have heard, and have acutally down loaded the
software (can't remember the name). But there was some
discussion on what O/S versions it works on. If we can
get it to work, it would be a good thing to use. I
believe there is someone on the list that does use it.

The MRF shows the low pressure system approaching us from the
west and then falling a part before it can pass over us. The winds
are indeed predicted to be very light. Interesting.

Did you use the Bully Creek lat/lon for getting the data file? I found
this made a difference (huge) over using BOI weather. I have been using 12z.

On further examination, I did use Bully Creek in the Balloon Track program but not the forcasted data. Will be sure to do that tomorrow. I did do a 1500UTC time and there was little difference as compared to 1200 UTC.

Paul,

Mike - the keeper of the helium - has it all under control.
He will have the helium ready for launch time.

It would be really cool to package "mission control" in a utility trailer that could be towed to various schools and events kind of like the Twin Falls group does. The trailer could be the storage space too.

At 04:08 PM 8/22/02 -0700, you wrote:

Yep, I am still here Paul!

Sorry just been concentrating on getting the webpage up and running!

So do we have two helium tanks to pick up? I will pick them up on Friday. I am also willing to donate money for one tank of helium.....

Everyone go check out the page again, let us know what you like or not like. Also, if there is anything else you want to see on the page, let us know! The archive page is not finished yet, but will be worked on next week.....its a work in progress!

I love the featured photo in the upcoming events section ;-) but I would like to see less text on the home page. Perhaps some thumbnails or other small graphics along with a synopsis of the excellent information you have on there. You could edit your text down into a 'teaser' and move the longer description onto a link. I am thrilled to see no overuse of animated gifs, shockwave or other distractions. Just a nice clean fast loading website. Just my .02 worth!

I sure appreciate your efforts for the group!

Latest AVN Short Range data calculated from the Bully Creek Campground
Site has a flight of 123.6 minues at 111.6 degrees and 8.1 miles.
Predicted landing would be on the west Vale city limits at 43.9865/-117.258.

Mike,

The account was credited with enough money for one tank that
I'm aware of. I don't know if anyone else put more money
into the account or not. We do need two tanks.

My only comment on this is a lot of graphics
(pictures) really hurt those of use that have only
dial-up service. Sometimes there can be too much on
the first page.

3744. Re: [tvnsp] Helium and TV02E

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-23 04:15:55 UTC
From: Stephanie Steele
Topic: 3725 Message: 3744

I agree with John. Web research has shown that you have a maximum of 20 seconds to convince the 'new' viewer to stay on your web site. Also, the same research shows that most people will not scroll down a page to see what is on the bottom so try and keep each page where it will need a minimum of scrolling. This also helps limit the size of the page and keeps it loading fast. If the site loads slow you lose people's interest. Graphics must be few and small to keep the page loading fast on dialup connections. You can also make the page visually and informationally interesting while the graphics load by tweaking your html code.

AGWPE (AGW's Packet Engine) is the name of the software for using a sound card. I'm not sure how it would work on the older slower machines we're talking about. These might be a very good candidate for UIView or WinAPRS. APRS+SA has a lot of nice features but it loads the processor down more than some and adding AGWPE to the mix will only make that worse. I'm sure UIView supports AGWPE but not sure about WinAPRS.

Scanner's could definitely be used and I've heard that they can sometimes be found at garage sales and the like. However, my huge sampling (1 scanner vs HT) shows that the scanner is much less sensitive than the HT. It would be worth checking a bigger sample though.

As far as antennas the TV twin lead or other J-pole might be a good way to go. They've got a good reception pattern and especially the twin lead ones are cheap. I've seen plans for one where the twin lead goes in a length of PVC pipe for added rigidity. (You have to change the length slightly because the PVC affects the velocity factor.) I'm partial to the aluminum J-Poles that I've built, but I'm not sure on the cost to build them from scratch. I have used one of those with a tire mount and a couple lengths of RS mast at my daughter's school for an APRS demo.

One other thing to think about... We may want to see if we can buddy up two or more monitors (maybe sacrificing the old 486 machines) so that more kids can see at once. LCD projectors would be nicer, of course, but probably out of our budget...

Bill

3746. Flight Prediction - TV02E 0100 MST 08/23/2002

Yahoo group: tvnsp (2000 — 2002)

Using the Bully Creek Lat/Long, I got the following:

Bearing: 81.1 degrees
Distance: 8.1 miles
Time: 123 Minutes.

Landing is at:
Lat: 44.048
Long: -117.247

Don't know if you can make the landing site after
launching. It might be close. :-)

One other note, has anyone looked at the track for the balloon. It will actually do a double loop, once going up and once going down. Talk about shear winds aloft.

Where would a launch from New Plymouth put us? Paul and I were at the Snake River ARC club meeting Wednesday and there are several people who said they would be interested in "Chasing" but that arriving for the launch prep was too early for them. If we are over in Vale, they probably wouldn't be able to make it from Nampa/Caldwell for the landing.
With a distance of 6.3 miles I don't know that you could call this a chase, it is more like a morning stroll, but we should get a couple of records out of it, shortest distance and closest to prediction.

I was thinking the same thing. If the predictions continue on this trend
(and at this late hour I would suspect they will) I was going to suggest
a launch from somewhere closer in at a site that would put the landing
in a good and convienent area.

Try running a prediction for 18Z tomorrow as well. The winds between 25 kft and 50 kft appear to change rapidly through the morning hours - in general, increasing from the west. Also be sure to compare Eta vs. AVN results.

Make sure your launch site permits landings 20-40 miles east as well as close-in landings.

Here are the definiive sites for sound card packet.

http://welcome.to/uiview

and http://www.raag.org/sv2agw/agwsc.htm

I believe all versions of APRS support sound card
interfacing. UI-view looks real interesting,but i
have not played with it much. In the beginning it
did not have moving maps,so it did not appeal to me.
I believe now it supports Precison mapping,so it might be
worth investigating again.The price is very reasonable
for registration. Also very stable from what i have read.

Maybe some sound card gurus could help here.
I have plenty of tnc's,so i have not really done
any APRS packet with a soundcard yet.

I have only used the soundcard to generate DTMF,CW and WAV
files over the air with a Rigblaster.

>>> tonybarrett@... 08/22/02 05:12PM >>>
Tony Baca (W7VI) and Gene Pentecost (W4IMT), both very active local hams,
are experts at using sound cards as TNCs. Do these machines have sound
cards? If not, I hear old sound cards are pretty cheap and readily
available. Some people even give them away to their friends.
:-)

73,

Tony

Hi all,

The flight predictions continue to show a very short flight with a NEE track. Nothing really seems to be changing much in the forecast.

I have been playing with the data to move the event closer in due to the predicted short flight path. There are any number of locations that will work but one I have been playing with is a launch from the Ontario Heights area near SRCI which puts the landing near the Payette Junction on the Oregon Slope. This would avoid any towns/cities and would minimize the chance of a landing out in the pucker brush. It also would have a high probability of flying over my house ;-) The predicted NEE track for this flight makes finding a good location a little tricky. Could someone else poke around and see what you could find.

SRCI (estimated)
44.08231
-117.08497
2250

Looks like there will be a lot to discuss at tonight's meeting.

I don't know if they have sound cards. I hope we can look them over after the TV02E launch. I was thinking along the lines you mentioned. Even if they don't have sound cards, buying sound cards may be cheaper than buying a TNC.

The bad part of that track is that the ground photos will all show the
same thing.

Has anyone looked into launching someplace closer to Boise? Are
the winds predicted to be close enough to the same?

Now the MRF doesn't show the low breaking up until Saturday night, our time. We're predicted to have stronger winds also. The capsule should go primarily east according to the current MRF for Saturday morning.

The Washington, Oregon, Idaho border will have the winds we want.

Paul

> Looks like there will be a lot to discuss at tonight's meeting.

Can somebody be sure to post a summary?

We won't be able to make the meeting tonight, but due to a sudden postponement of the first soccer games we suddenly find ourselves available Saturday so we may try to help with the chase. (If we're not able to drag the kids out for the chase I'll be glad to help with posting data objects as before.)

Obviously, we'll need to know meeting place and time.

Bill

3778. Re: [tvnsp] PCs

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-23 17:37:18 UTC
From: John Stone
Topic: 3723 Message: 3778

In talking to Russ N7SMA at the SRARC meeting last Wednesday night, he said that the PCs do not have Sound Cards. The reason I suggested the idea originally is that it may be a less expensive solution, and it makes setup easier for school groups to do. Whoever volunteers for mission control should learn how the software works and it should be tested to see that we are able to track objects.
John
K7JPS

-- Paul Wrote

I don't know if they have sound cards. I hope we can look them over after the TV02E launch. I was thinking along the lines you mentioned. Even if they don't have sound cards, buying sound cards may be cheaper than buying a TNC.

3794. Miscellaneous comments

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-23 20:37:40 UTC
From: n1ltv
Topic: 3794 Message: 3794

> AVN Short Range prediction now shows that a launch from
> Bully Creek Campground would produce a flight of
> 123.6 minutes.

The winds have no effect to on the balloon flight duration.
It is determined only by burst altitude, and balloon ascent
and payload descent speeds.

The slight variations in launch time noted have to do
with the imperfect way in which Balloon Track handles
ascent and descent.

> Did you use the Bully Creek lat/lon for getting the data file?
> I found this made a difference (huge) over using BOI weather.

This huge difference is due to the Oregon/Idaho upper
air circulation feature mentioned Wednesday which makes
the winds vary highly with position in the area of the
circulation.

Hank

3795. Re: Predictions

Yahoo group: tvnsp (2000 — 2002)

> Make sure your launch site permits landings 20-40 miles
> east as well as close-in landings.

This is good advice from Mark.

The models have shown terrible convergence so far.
Good convergence would typically be +/- 5% variation in
range and +/- 2 degrees in bearing.

The geographic sensitivity of the winds (in reality and in
the models) means that the actual track may diverge from
even the best and latest prediction that can be made.

The good news is that the circulation center (zero wind speed)
has drifted eastward since Wednesday's model run and is now
in the vicinity of western Idaho. The exact center location
depends on the upper level at which you're measuring
the wind.

This means that with a short track, if that's
how it actually turns out, it doesn't much matter if the
predicted bearing is way off or the predicted range
(as a percentage) is way off.

Be cautious about a projected short track though, because
not far away (geographically) in the models the upper level
winds are moderately strong from the west.

Hank

3800. [tvnsp] Flight Predictions TV02E 1600 MST 08/24/2002 - Supplement

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-23 22:49:18 UTC
From: Stephanie Steele
Topic: 3800 Message: 3800

Flight launched from Anderson Corner now shows 64.8 degrees and 18.9
miles landing NNW of Letha.

Current conditions make Bully Creek again a viable launch site with a
flight of 14.0 miles at 61.7 degrees. The current landing position would
be between Hwy 26 and I-84 NW of Ontario. This path has a lot of room
for the flight to go long without any hazzards.

10:22 MST - AVN Data for 12z on 08/24/2002 from Bully Creek has the flight traveling 19.1 miles on a heading of 60.2 degrees landing at 44.1668/-117.0754

10:24 MST - ETA Data for 12z on 08/24/2002 from Bully Creek has the flight traveling 13.7 miles on a heading of 50.1 degrees landing at 44.157/-117.1979

That's all for tonight folks! I'll run final calculations in the morning at 5am.

Max altitude was about 92,000 ft. Data looks pretty consistent.
Looks like the landing will be about 25 miles NE of the launch
site, or a little east of where I-84 crosses the Snake River.
Hopefully the landing isn't too close to the river.

I think 84 just parallels the Snake. I've got the balloon
landing in about the same place, but maybe a couple miles
short so it could be close to the river.

02E did quite a loopback just like the Boise sounding this
morning.

Date: 2002-08-24 15:55:27 UTC
From: Mark Conner
Topic: 3809 Message: 3809

I think Paul and company have a little hiking to do:
http://www.topozone.com/map.asp?z=11&n=4901899&e=488236&s=25

This is the location of the last report from about 1000' AGL.
The balloon was moving at about 10-15 mph at the time, so the
actual landing should be near this.

This is on the side of Indian Head Mountain, elev. 3643'. The
landing site is at about 3100' and the river elevation (where all
the roads are) is about 2100'. The landing is about 0.7 mi from
the road, but the topo map indicates at least a foot trail
heading to near the landing site.

Terraserver shows there may be some sort of cabin back there and
a trail to it:
http://terraserver.homeadvisor.msn.com/image.aspx?t=1&s=10&x=2441
&y=24510&z=11&w=2

Attachments: 1 described; binary payloads are missing from this source WARC

Here's the last position (STH and DBA at virtually the same
place on this map scale). 02E managed to reach Idaho by a
whisker and in the process barely missed the Snake River.

It's already up 3100 feet on a 3650 foot peak and not quite
landed. I guess there will be stories to tell. :)

3818. KD7PIT-1 on findu at 2870 feet

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-24 17:54:24 UTC
From: n1ltv
Topic: 3818 Message: 3818

Maybe Jason has hiked in to the landing site.

Findu has him at 2870 within .1 mile of last
payload position.

Plotting the balloon's track
I noticed that the payload seems to have changed
direction at the very last minute and blown downslope
to the southeast a little, so this altitude above
would not be inconsistent with the reported higher
last altitude.

Hank

3822. HARIN Status?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-24 19:56:51 UTC
From: Tony Barrett
Topic: 3822 Message: 3822

Hey Steph,

What's the story with HARIN? Findu saw it 54 minutes ago, but it doesn't show up on my map or in my station list and I've had WinAPRS running for hours. Also I noticed that I don't have any traffic from eastern Idaho and Utah. I don't think I'm getting anything that I normally get through HARIN.

I know its got a bent antenna mount, but does that explain the reports we're seeing, or lack there of? Why does findu see it?

Any ideas?

Thanks,

Tony - N7MTZ

3823. Possible sound card source

Yahoo group: tvnsp (2000 — 2002)

From: Mark Conner
Topic: 3823 Message: 3823

Got this from one of the local swap net e-mail lists. Area code would be 402. Might be worth a call for putting sound cards in your PCs.

Also, you can get 16-bit basic cards cheap at most computer swap meets.

73 de Mark N9XTN

FOR SALE: Lots of computer parts including cases, cards, drives, and CPUs. AMD 950 & 1.1G processors. (462 slot) Sound cards for both PCI and ISA slots. PCI & AGP video cards.
2 x 9G SCSI drives. 1 new CD-ROM drive. Used floppy drive.
3 x new SCSI controller cards. A Cisco 3661 Router for $15k

Hello,

If you are looking the cheaper way to decode packet using
old PC I sugest to use a hamcom class interface with pktmom
software. The interface is less than $10. The software run under
DOS or WINDOWS and you connect the interface to serial port
1 or 2.

Regards.

Gustavo, LW2DTZ

Message: 9

From: "John Stone" <k7jps@...>
Subject: Re: PCs

In talking to Russ N7SMA at the SRARC meeting last Wednesday night, he
said that the PCs do not have Sound Cards. The reason I suggested the
idea originally is that it may be a less expensive solution, and it makes
setup easier for school groups to do. Whoever volunteers for mission
control should learn how the software works and it should be tested to see
that we are able to track objects.
John
K7JPS

-- Paul Wrote

I don't know if they have sound cards. I hope we can look them
over after the TV02E launch. I was thinking along the lines you
mentioned. Even if they don't have sound cards, buying sound
cards may be cheaper than buying a TNC.

Paul

3829. RE: [tvnsp] TV02E Altitude

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-24 21:58:10 UTC
From: K7JPS - John
Topic: 3825 Message: 3829

Thanks group for the great morning, it was a wonderful flight. And congratulations to Stephanie on 3-Peat One. Watching the last 7,000 feet of ascent, and the burst was absolutely stunning. Now if winds are favorable during the Idaho Star Party in two weeks, and we could put the balloon in about the same position for the astronomers, then maybe someone can get a photo or video through a telescope of the burst and we would have something for the record books.

Steph,

The highest report in my log was 92,326 feet. But then Paul's capsule only got to 91,938. ;-)

I enjoyed watching it all very much. You folks are awesome!

73,

Tony

Everyone,

Just a little something about today's flight! Thanks Hank for the track map!

This will only stay up for a week or so, then be banished to the archives forever!

It was fun!!!

Hi Tony,

It's really a super event at a beautiful location. If we had to pay for the facilities it would never happen. Plenty of space in the bunk house (probably sleeps 30 or so), tons of tent space, and of course RV parking , some with hookups. All the 'classes' are held outdoor under a large 'picnic' area and we always seem to have a movie on Saturday night under the stars. Hope you can make it.

Stephanie

It sure was. We noted that it appeared we had a rather large chunk of balloon still attached since several pairs of eyes were still tracking it after the burst. The recovered evidence confirms this.

It occurs to me that we just need a "simple" TNC for this application. It doesn't need APRS support or any other bells and whistles. AAMOF we could easily use an older TNC in KISS mode.

Might be a good idea to start watching EBay and other sources for cheap TNCs. (Generally you get a much better price if you aren't in a hurry.)

I don't know is mine would be called simple, but I
use an old AEA PK-88 for my APRS.
The only limitation it has is it needs a computer
hooked up to do anything. But the idea
you have it will work just fine.

Doug

3837. TV02E Recovery Photo & Preliminary Results

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-25 04:28:07 UTC
From: Tony Barrett
Topic: 3837 Message: 3837

Great stuff on the website!

I got out my protractor and used a few visual clues to guestimate horizontal. Near as I can tell you are on about a 27 degree slope. Looks like we've got a few mountain goats in our group. Sounds like everyone had a terrific day.

How about adding a caption near the photo listing the names of our heros? Under the hats and sunglasses I'm not sure I can make everyone out. Who was behind the camera?

Thanks,

Tony

Hi Ralph,

Thanks for the kind words. I had a blast and was very lucky to get to hand release the package and then be the first to the capsule (thanks to Jeff, Justin, and Paul who all could have passed me on the steep hill but held back due to their kindness ..... and to a much lesser degree my threats to throw them back down the hill if they passed me ;-) Fat girls don't climb hills but when they do they climb them slowly!)

The landing coordinates were:

44.27163
-117.14834

Stephanie

Eastern Scientific sells Kaymont distributed Totex balloons.

Maybe it would be worth seeing if orders through Eastern
would be better handled than the way Kaymont has handled
them lately.

I received email from yet another ballooner that he was
getting poor treatment from Kaymont.

I remember getting an email (sales oriented) from an
Eastern representative and he did not respond to even one
email I sent back to him.

Balloon supply doesn't seem to be a high hospitality
business.

Hank

I didn't have too bad of luck from Kaysam the other day. The biggest problem was that he pretty well insisted on having a fax machine and faxing an order request back and forth with a signature. Although, I received the balloons the next business day after faxing my signature, so apparently they were shipped without it... go figure.

I dealt with a guy named Ed. He got $48 for a 1200 and ?$32? for the 600's. He wouldn't meet Kaymont's prices on the 600's but the 1200's were almost $2 under Kaymont. I didn't get the lady who I originally talked to's name, but she had a slight accent - I've kind of forgotten now, but I think it sounded like an afro-american accent. She was willing to meet Kaymont's prices...

Unfortunately, it's probably like many other specialty businesses... There aren't many other games in town and the vendor knows it.

Worse yet they have big customers that buy large quantities and small customers that buy really small quantities with probably not much middle ground.

Bill

Maximum altitude heard from here for KD4STH-11 was 91,940 feet and for
KC7DBA-11 was 92,372 feet.

3853. Initial Report

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-26 20:29:50 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3853 Message: 3853

Several items to report on so far. I am in the process of putting the rest of the logs together.

Stephanie's capsule interior is very sensitive to external air temperatures, while her battery comparent is more protected. The interior temp dropped below 0 degrees F.

Three layers of MLI is about 6 degrees warmer than one layer. But a bare blue cube stays just a bit warmer than one layer. Next experiment will compare a combination of MLI and dark jackets. The MLI becomes effective once the altitude passes 30,000 feet. It reaches it's max effectiveness at altitude above 52,000 feet.

The camera control cable was connected to the flight computer with the correction orientation, but the cable was made backwards. The camera would never recieve commands to operate. The second problem is that the routine that determines when to take pictures used a variable that was defined too small. Both of these have been corrected and the cable tested.

I have wasps at my apartment and would like to send them up on the next flight

Paul

3854. Balloon Pilot Wings

Yahoo group: tvnsp (2000 — 2002)

Can I get the external minimum ambient temperature from you before we delare my capsule interior as being "very sensitive to external air temperature". My capsule, which reached a minimum cabin temperature of -2.2F, has three layers of MLI with scrim which was the same your +6F test block so based upon the results of your experiment you could extrapolate that the external temperature would have been at -8.2F. If the true external ambient temperature was colder than -8.2F (as I suspect it was) then I need that figure to see how much more efficient my actual capsule was then was your experiment block. My capsule interior is no less protected than any other TVNSP capsule interior has ever been and I believe it may be even somewhat more resistant to thermal loss. Let me have the numbers when you can.

It should be noted that my battery compartment had a minimum temperature during the flight of 21.2F which is a net difference of +23.4F over the cabin temperature and fully warm enough to support any type of battery pack. I intend to repeat the experiment to validate the results before declaring any victory over the evil cold gremlins aloft.

>

> The MLI becomes effective once the altitude passes 30,000 feet. It
> reaches it's max effectiveness at altitude above 52,000 feet.

This is good data and supports my contention that the MLI/Scrim construction technique has merit for gaining all possible thermal protection.

> have been corrected and the cable tested.

Did you have the rabbits make the cables again? You've really got to start checking their work prior to flight. They must have written the flight code too! Silly rabbits! ;-)

Also, I have an exorcist scheduled to go to your apartment and expel the evil voltage eating gremlins so you don't have to worry about installing your batteries prior to launch time. ROTFLMAO

>
> I have wasps at my apartment and would like to send them up on
> the next flight

By the way, the rabbits emailed me and said they were having a few of their friends over for a visit. They told me that their visit would probably 'bug' you.

Te he!!

Stephanie

Let me rephrase that, the interior of the capsule is more sensitive
to ambient air temperatures that is the battery compartment.

I have printed six copies of all the graphs I generated. I'll hand
them out when I see TVNSP crew.

Stephanie, your lowest temperatures were, 20 deg for the battery
compartment and -3 deg for the capsule. At balloon burst your
battery compartment temp was 28 deg and the capsule temp was
10 deg. The coldest temp for the capsule was during the descent.
The battery compartment's lowest temp was at landing.

My coldest temp was 11 deg and that was during the descent.
Prior to balloon burst my lowest temp was 48 deg.

I think the biggest difference is that my capsule is dark in color.
However, I'd like to test the effect of styro peanuts on temperature
in a future flight.

We need to pick up a few of the PCs for testing. When would someone be free to help out with that? We'll meet at Simplot.

From what I'm hearing, we're better off adding a TNC to the PCs, rather than trying to use any sound cards. Please keep your eyes open for some inexpensive TNCs. We could probably use two of them.

We'll also need to pay for another copy of APRS+.

Paul

Hi Paul,

I also suspect there is a thermal gain from your dark capsule color. With mine be 1/2 light and 1/2 dark I suspect there is little or no thermal gain from the cover color.

Do I understand that the coldest external temperature you recorded was +11F ? Do I also understand that your external ambient air temperature at peak altitued was +48F ? Isn't that unusually warm for 92K feet?

If I get similar temperature results on the next flight then I will fill the capsule with peanuts on it's third flight to see what difference there might be. Other than simply increasing thermal mass I can not see any possible insulating benefit from the peanuts. I also can not see styrofoam peanuts performing as any type of measurable heat sink, but it would be interesting to see. For the experiment to be meaningful it would require that we get repeatable results with the current configuration prior to trying the peanuts.

My external air temperature was flaky on this flight. Past flights
indicate the ambient air temp dropped to -60 deg at 50,000 feet and
began warming back up. At balloon burst the outside air temp may
have been around 20 deg.

Here's a table to make my notes more clear.

KD4STH-11 KC7DBA-11 KC7DBA-11 Air
battery capsule
Launch 70 60 55 65?
50,000 ft 57 35 5 -60
90,000 ft 45 28 9 20?
Descent 25 21 -2 ?

I'm reading these off a graph, so their error may be around 1-2
degrees.

Russ, could we pick up the PCs on a weekday after 5:00 PM?
Would it be better for us on a weekend?

I'll get out of school at 5:00 for at least the next couple of days. I
suppose I don't need to be there to pick them up. Mike, can you
still let us store the PCs at your garage?

By the way, Mike, did you want a sample of that rock we found? I
think it's a pegmatite with quartz and a feldspar, but it scratched
with a steak knife, which should indicate its hardness is less than
5.5 (roughly) and feldspar has a hardness of around 6.0.

At 14:58:25 the altitude was 28,141.3 m
and at 14:58:59 the altitude was 26,866.8 m

So between those two times.

3866. Suicidal in Space?

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-27 19:39:53 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3866 Message: 3866

Have you ever wondered what the procedure is if an astronaut
becomes suicidal onboard ISS?

Then check out.....

http://www.spaceref.com/iss/ops/8647.suicide.emerg.pdf

John, can you add this to the checklist? You never know how
someone may feel if we suffer another mission failure!

Paul "I feel better now" Verhage

Can I get some data for the last flight to post with the pictures? I have almost all information, other than the archives copied to the new site. There are getting to be so many links, I am going to have to do some reorganization of the current links by grouping.

Would appreciate the data! Thanks.

3873. Balloons for TV02F

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-28 14:42:25 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3873 Message: 3873

I finally was able to order a balloon. Kaymont only has an answering machine responding at their phone number, so I placed the order with Kaysam. They charged about $1.50 less for a 1500 gram balloon. UPS delivery is expected to take 2-3 days.

Paul, I purchased the entire inventory (1- Balloon Pilot Wings, and 1- Sr. Balloon Pilot Wings) of Dinty's Market in Biggs Junction, OR. They are the second convenience store on the north east corner in Biggs, which is exit #104 on I-84 in Oregon. The two of them cost $11.62 which is half the price of what I can find on the web (not counting the 600 mile round trip). If you want to contact them, I can send you contact info later. This is what I have found on the web as sources for Balloon pilot wings.

www.garciaaviation.com/wings.html @ $9.95 + $4.95 S&H
www.icbm.com/hotairballoons.htm @ Sr. BP $12.00, BP $10.00, both $20.00 + $4.50 S&H
The balloon Pilot wings were issued by the Army Air Force in the 1930's and 1940's. If you would like to read about the history of wings try these: websites www.icbm.com/hotairballoons.htmwww.303rdbga.com/badges.html

According to www.b24bestweb.com/wings-srballoonpilot.htm the Senior Balloon Pilot wings were awarded for 10 years and 100 hours of flight time. These numbers don't seem to be very accurate but we could come up with similar criteria for our group.
Another option I found was www.nametags4u.com/nametags.html that makes nametags with the wings embroidered on them. I took the time to make a couple of designs we might use. The first is the standard balloon pilot wings, the second is observer wings, but we could probably call the sales department and design a nearspace stack logo for the center of the "O". The cost of these name tags are $17.50 + S&H.

John
Nice work on researching the Wings.

If i had my preference,i would choose the emboidered patch.
They may not be as transferable as the hard emblems,but
they have more "eye appeal" to me. Too easy to loose or misplace
pinned emblems.

The patch may look as nostalgic ,but hey, i'm a futuristic
type guy.

"Not stuck in the past" (sorry about that Captain Cody) Randy

I like the first design best. Are crews willing to pony up $17.50 for
their wings? I'll buy myself a set.

Come to think of it, it might be hard to read all of the lettering on
the first insignia. We may want to simplify the background and
bring out the details of the wings and name.

How about a black background for near space? Or even the edge
of the Earth at the bottom, black skies above, and the wings and
name on top?

Paul

3881. Re: [tvnsp] Balloon Pilot Wings

Yahoo group: tvnsp (2000 — 2002)

From: Rick Widmer
Topic: 3853 Message: 3881

I strongly suggest you make up your own design. The military people who actually earned the right to wear this kind of insignia don't like it much when unqualified people wear them.

From: http://www.dyehard.co.za/opinion.htm

MILITARY INSIGNIA
Speaking of the military, unless you (or a direct relative) actually served in the particular unit, you shouldn't be wearing insignia of military units. One, it gives the sport that militaristic look we don't want. Two, (and most importantly, in my eyes) men and women trained and fought hard for the right to wear that insignia, many died wearing it. I know a few players who wear the insignia of the unit they served with in Viet Nam or the Gulf War. Others lost a loved one in an armed conflict and wear it to honor them. They wear it as a symbol of pride, or remembrance.

The basic message is: If you haven't earned it, don't wear it.

It is more than just a piece of embroidered cloth that looks cool. It shouldn't be taken lightly, or treated as some sort of Christmas decoration for your cammies.

Rick Widmer,
Formerly US Navy. Authorized to wear the National Service Defense Medal for Vietnam era service, and proud of it.>

3882. Mt. Harrison repair trip

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-29 00:12:59 UTC
From: Stephanie Steele
Topic: 3882 Message: 3882

Hi Guys,

I still have not heard if we are going to attempt to repair Mt. Harrison this weekend. Can you please let me know if you are available either Friday, Saturday, or Sunday. I have written to Pat and Jack but have not heard back if either of them would be able to help with tower climbing. I have copied the TVNSP group with this message in case someone in this group wishes to come along to help with climbing the tower.

I have the replacement antenna but intend to attempt Lee's suggested repair first. I would rather maintain the new antenna for a new site if possible. Please let me know.

Hi Stephanie,
Sorry about not returning your email but I have been working out of
town.Labor day weekend is no good for me as we have plans for the
weekend.Sept 7th is already taken up too.Also the 14th isthe day i had
reserved for work up at Lime Hill .
The reason you have not heard from Jack,kc7sla is that his computor is
down and he doesnt have any way to get his email you might try calling
him at work or at home.

Paul,

Mike has informed me that after I had posted the data from the other tvnsp website, that some of it needs to be updated. Can you please review the new site and let me know what needs to be updated or added? Only when you have some time!

Thank you!

Andrea

There's a set of archived files at the old site you can move over.
The first 10 or so missions are recorded. The site looks good. Are
you able to put the TVNSP logo into it?

I'll gather more stuff for you.

Paul

3887. Business Cards and Mag Signs

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-29 22:17:11 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3887 Message: 3887

Now that we have a website and logo, I'd like to get new business cards and some mag signs for cars. It's easy enough to divide the cost of the business cards. I'll need to know how many people want mag signs for their cards? Plain signs are $40 for two. With the logo, they'll cost more. There's no reason you have to purchase two of them for your car, we can split up the order.

Please let me know if you're interested. I'll get a cost later this weekend.

Paul

3888. CD-ROM business cards

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-08-29 21:28:21 UTC
From: n9xtn@cox.net
Topic: 3888 Message: 3888

While I was at CompUSA about two weeks ago, I noticed a box of CD-ROM business cards. They are rectangular, business-card-sized, and apparently fit into a CD-ROM drive OK. I believe they stored either 30 or 50 Mbytes. Pricing was somewhere about a quarter apiece if I remember right (around $10-12 for 50). Might make for a unique handout item, and also would be lighter than a standard CD for sending aloft.

- Mark

I think I saw the same thing. I didn't pay much attention to them at
the time, but you bring up an interesting idea. Perhaps we could
place a webpage of interesting images and info.

Paul

And another thing!!!

We should send them up by the handful and write the flight, date,
and altitude on the card.

Capitol idea, Mark.

The electronics teacher at Vallivue HS expressed an interest in tracking a balloon flight from the high school's ham station. I picked up a grant form from Fred Meyers and hope they can help pay for the flight (they need 4-6 weeks to process the request). I've written a rough outline of the lessons that must be given. I'll contact the teacher and tell him what I'd like to do. If this works out, we'll have to meet with the students a week before to teach them the basics of balltrak, liftwin, and APRS+. I'd like the students to run predictions and them act as mission control for the flight.

Does anyone have a problem with this (admittly rough) plan? any sugested refinements?

Fred Meyers needs the organization they donate to be a 501C3 organization. Dough, is VOI? If so, I'd like the Fred Meyers' donation to go to VOI for the TVNSP account.

I plan to ask for $50 for the balloon, $100 for the helium, $20 for the batteries, and $20 for the film and photo processing.

Paul

When we did our school launch, we blew through $500 in no time. We had handouts for all the students (20 pages * 50? students), a binder to put everything in, video tapes (of the launch and of the ATV), vacuum pump/bell jar, dry ice, thermometers, etc. I think the overall experience wound up costing closer to $800-$1000.

Just something to think about if you're planing any kind of experiments (especially labs) as well as anything for the kids to take home (copies of pictures, video, balloon track, certificates, etc).

The MRF is predicting a low pressure trough to our west. The jet stream will passing over Idaho with high winds from the south.

We'll need to launch as far south as we can if this holds up.

I spent the weekend getting the ATV's robotic arm updated to new power connectors and the servo cables tiddied up. Last night I updated the flight code to operate the arm. Because of the size of the code, I'm now using two program slots of the Basic Stamp. I hoped to wait until after this year's flight season to learn how to do this. Well, anyhow, it all works.

I will do a capsule build between classes today and along with making notes for our presentation at ISP (power point). I'll try a ATV test tonight (I hope).

I agree with Rick. If we want to where a special
emblem let's make one unique to us, not one that was
designed by the military. As Rick has indicated, the
members who earned the right to wear it should be the
only ones to wear it. I have seen a lot of 'PX Heroes'
that have bought emblems to wear that have not really
earned that right.

How far up or into the neck does the cup extend? Is it a permanent part of the balloon? Sounds like it gives extra strength to the neck area of the balloon. Probably other good reasons for the cup that a novice balloon person does not see.

Did a quick (and dirty?) prediction for Saturday. I
don't have the lat/long for Bruneau area so used
Boise. I came up with:

Bearing: 13.5 degrees
Distance: 93 miles
Flight time: 122 minutes.

Will have to look this evening on Street Atlas to see
where this puts us from the State Park.

Anyone else done this yet? Also, can anyone come up
with the lat/long for the Bruneau Park area?

Paul,

I assume the one that just arrived is from Kaysam? Sounds like it from the description.

I used a couple of Kaysams that the NWS provided for a launch at an event they supported. It was a 650g and is a dark greenish-brown. The balloons are actually two pieces joined by a solid plastic ring (the "cup" Paul mentioned). The two I had shredded rather cleanly above this ring without the knotting and such that the Kaymonts tend to have. I think I owe Don Pfister a digital photo of what mine looked like afterwards (I still have at least one of them).

Also, the Kaysams I had came with larger necks. I made an adapter for my fill device that will fit either the larger Kaysam or the smaller Kaymont necks.

They have a Acrobat file on their presentation to the space grant on
their webpage. They are following the same format for capsules as
TVNSP. Their flight computer is a higher level one than the Basic
Stamp, but also more difficult to program. I've asked them to
subscribe to KNSP so they can keep us updated.

Mark, Zack, and Don, they're in your neck of the woods. Perhaps
you can coordinate a launch with them.

It is looking pretty unlikely here at work that i can make the Bruneu launch.
With a short week after the holiday,we are in our usual "hurry up" and "keep the customer happy" mode right now. Most of the purchasing agents we supply, seem to take an extra day off before long holidays and panic order the following week (this week).

Anyway, i might have to be in the monitor mode this time. Will not know
for sure until Friday.

The BAS has given TVNSP $50 for the ISP flight, combined with the $100 from Bruneau Dunes, that pretty much pays for the launch. We speak twice at ISP, once on Friday before the launch and then on Saturday afternoon, after the recovery. We'll be carry a t-shirt for ISP on the capsules.

Stephanie will be at the NWAPRS conference. Randy has said he can't make the launch because of work. Jeff won't be back for another day or two. I need to make sure we have enough to launch this weekend. Can I get a show of hands of who will be there to help? We'll need to meet at Bruneau on Friday night for the flight readiness review. I wonder if we can launch from Bruneau Dunes? The flight should go pretty much north and we may recover near Fairfield.

Deb and I will try to be there. The only concern we have is the distance the balloon will travel. Last night, if launched from the State Park, the balloon would land in the Lowman Area. That would not be good.

I have not been able to obtain the forcasted data for Saturday today, the server appears to be down. However, the MRF shows the weather system for Saturday to be different than what it showed yesterday. It appears the winds will be more from the sw to the ne.That would be a good thing for chasing. And may allow us to launch from the State Park.

Would there be any consideration of doing a hot launch so the balloon would go up faster and possibly not travel as far? I know that would lower the burst altitude but may be a benefit in the long run.

Also, will be have the ability to hit the internet from the classrooms down there? If the winds are in a state of flex we may want to check the data Friday night late and again Saturday morning, delaying launch a little.

My thoughts on all of this.

Thanks Rick for the Lat/Long for the State Park. I did
a predicition from the Observatory for Saturday. Using
the following variables:

Ascent: 1200fpm
Descent: 1200fpm
Burst: 90,000ft.

Have the following:

Distance: 80 miles
Bearing: 28 degrees
Time: 107 minutes.
Landing Lat/Long: 43.9243/-114.9448

This appears to place the balloon's landing area
NorthEast of Atlanta.

Anyone else do this to confirm my guess work?

It looks like you'll have strong winds all weekend between 20kft and 45kft. The Saturday 15Z forecast from this morning's run indicates about 100 kts in this layer from 205. Sunday is only slightly better.

I don't see very much hope for a change to better conditions. Looks to me like a 80-120 mile chase to the NNE no matter how you cut it.

I will try to do some more guess work this afternoon
or this evening. I will also do prediction for 1400
and 1600 fpm ascent to see the difference in distance.
Will also try some different launch areas south/south
west of Bruneau SP.

You are right about Atlanta. It is in the mountains,
just south of the Wilderness area.

the following variables:

Ascent: 1200fpm
Descent: 1200fpm
Burst: 90,000ft.

Have the following:

Distance: 80 miles
Bearing: 28 degrees
Time: 107 minutes.
Landing Lat/Long: 43.9243/-114.9448

This appears to place the balloon's landing area
NorthEast of Atlanta.

Anyone else do this to confirm my guess work?

3929. Shortening the flight

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-04 20:18:29 UTC
From: n9xtn@cox.net
Topic: 3929 Message: 3929

Do you have any small balloons? If you put a whole lot of helium (close to 2 tanks) into a 300g balloon, you might be able to reduce your chase distance to a reasonable value. It would also generate about 20 lbs of free lift and about 1700 ft/min ascent rate.

Reducing parachute size would help you get down through the jet faster as well.

we can go with extra helium. The parachute is 5' in diameter.

Paul

3931. TV02F - status and thoughts

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-04 23:47:51 UTC
From: John Knapp
Topic: 3904 Message: 3931

I talked to Paul on the phone this afternoon. His thought is to launch from Burns Junction. He would take off his ATV since it wouldn't be received at the Observatory and the landing would be in the Weiser area. I haven't done the track yet but will do so let the group know what I came up with.

We also talked about ascent rates. If someone is familiar with liftwin, can we do rates of ascent between 1400 to 1800 fps? If so, what would the lift be and the burst altitude.

I will do Balloon Lift calculations tonight for 1400, 1500, 1600, 1700, and 1800fps and descent rate of 1200fps. Might also change the burst height to 80,000ft. Any thoughts?

If we can get the distance traveled to a short enough distance maybe we can still go with a launch near Bruneau SP.

Other input would be appreciated.

I hope so. It would make for a much better show for the groggy
astronomers who have been up all night that way... :) I certainly plan
on pulling an all-niter in the observatory both nights.

Paul,

I've got plans for being there Friday evening after work, what time is the TVNSP presentation? Then again, watching the discussion about landing locations, with the distance of the flight, I might end up staying home if we are launching from Burns junction. I haven't run any predictions yet, but will try to find time. I just loaded WBalTrak 1.7.7 on this PC so I should be up and running pretty soon with it.

Subject: [tvnsp] TV02F

The BAS has given TVNSP $50 for the ISP flight, combined with the $100 from Bruneau Dunes, that pretty much pays for the launch. We speak twice at ISP, once on Friday before the launch and then on Saturday afternoon, after the recovery. We'll be carry a t-shirt for ISP on the capsules.

Stephanie will be at the NWAPRS conference. Randy has said he can't make the launch because of work. Jeff won't be back for another day or two. I need to make sure we have enough to launch this weekend. Can I get a show of hands of who will be there to help? We'll need to meet at Bruneau on Friday night for the flight readiness review. I wonder if we can launch from Bruneau Dunes? The flight should go pretty much north and we may recover near Fairfield.

I will be there Friday afternoon around 5pm, we still have to set up a mission control in Bruneau somehow.

Do we have money in the helium account? If not I can pick up one bottle. We have a 1/4 tank, and a 2/3 tank at my house now, so coupled with a full tank, we should have enough helium.

3940. Status, 5 Sept

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-05 14:28:26 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3940 Message: 3940

Is Jeff back? Jeff, since we won't be flying the ATV unit, I'd like to use your capsule as a backup APRS tracker. My camera will get pictures of your capsule (the lunch sack one) below my capsule and the ground far below.

As for a weight, my capsule weighs in at 6.0 pounds. Jeff's may be 2-3 pounds. The parachute is 1 pound. So plan for a 10 pound payload for the balloon. Something like 5 ppl will give us a very hot launch.

The presentation at Bruneau is scheduled for 8:30 to 9:00 PM. Originally we were given an hour, but there was a scheduling error, so we have been reduced to 30 minutes.

I plan to bring my telescope and sleeping bag on Friday night. However, since it looks like we'll launch from Burns Junction, I'll drive home Friday night and leave from Caldwell Saturday morning.

We have a post flight presentation on Saturday afternoon at 3:30 PM. Jeff, do you still plan to operate Mission Control? We'll want to show the flight track and photos from the flight at the presentation. We're carrying an ISP t-shirt that will become a door prize when we return.

Speaking of Jeff, we'll need to get Jeff set up Friday afternoon. I'll bring a TV/VCR and some photos for display. The Flight Readiness Review (FRR) for TV02F needs to be completed before the presentation on Friday.

Last night I completed the assembly of the near space capsule. I've also wrote a test program to make sure every experiment is working. The test uncovered two errors involving the I/O ports of experiments. I can run the test during the FRR on Friday. So I know know the camera is plugged in correctly to the CC/PS. I also double-checked the size of the variables used in the camera routine. The capsule will attempt photos at 100,000 if we get that high.

I plan to leave Boise at 3:30 Friday. John, you can share my campsite, I'll have space. One update for the checklist. The audio beacon is the Aux switch.

Paul, it is possible to launch from south of Bruneau, overfly the State Park, and land north and east of Mt. Home. Only a thought but it would allow us to use the ATV for the Astronomers at Bruneau. I will have more details later but it might be a thought. Also closer for driving.

More later

The ATV could probably be made ready, but I do like the idea of flying Jeff's backup APRS. I suppose if the travel time for us is less, it's the way to go. This means I need to get those batteries built tonight.

That would be fine. Jeff, where are you?!

This would make the flight a triple module flight.

A thought, and I need someone to verify the figures, but if we launch from Riddle, Id., south of Bruneau, the landing would be app. 10 miles nw of Mt. Home. I used a hieght of 90,000ft, ascent of 1400fpm, and descent of 1200fpm. I am not sure if this would over fly the airbase but we will need to be careful with our prediction. I will do some more when I have time, but work is calling.

Someone else try this to confirm my thought.

We can't fly over the airbase. Don't forget, there's a bombing range
out there that we have to avoid also. Is it possible to launch further
north and east and skirt Mt. Home?

Ya, that would be great. I don't know what kind of setup John the Younger has, but I'm sure we can find a use for it. I have a PC data cable for my Kenwood and the etrex hooks into my HT so we are good there. If we do need it, perhaps I could run over there sometime Friday to grab it. Also, could I borrow a couple HT batts just in case we go for a hike. I keep having reaccuring dreams (or nightmares) about Davis Mt. Thanks Randy.

I was just wondering what we are going to do Friday night so I can prepare appropriately. After the presentation, are we going to look at stars, sleep, get up, launch or stay up burning the midnight oil into the next day? I'm guessing it will be chilly so sweats and jackets are a must? Do we need a tent or something? I'm sure we can all fit in John's new bus, Oh I mean SUV. :-) And since I have come to associate FRR's with Chinese food over the years (I think they call it Classical Conditioning: show dog food, the stimulus; dog salivates, the response) I feel it's only appropriate to take carry out. All in favor say I. Sorry for the gibberish, I'll shut up and go to my corner now.

Here's what I think we ought to do.
First, send an email virus to Saddam Hussein, then.., opps, wrong
plan.

We'll hold the FRR in early in the afternoon, before the
presentation. I'm trying to contact Bruneau to make sure we'll have
access to a networked PC. The final driving plan etc will be
determined before the presentation at 8:30. I was going to do
dinner before I left, but I don't mind eating out. Is there something
in Bruneau?

If we're launching close by, then I'll stay the night. If we launch in
Oregon, I'll drive home for the night.

I'll sleep under the stars on Saturday night and possibly Friday
night. There'll be open 'scopes all night, you just wonder from
scope to scope. I plan to bring mine on Friday night, even if I don't
stay Friday night. I may have to load some launch gear in
someone else's car.

Are we still a go with setting up a mission control at Bruneau? If I am to be helping out there at mission control, someone else will have to carry the helium tanks. If so, then I will spend the night at Bruneau Friday night. If not, I will be with the chase crew. John the Elder, did you get the trailer from the Snake River group?

No I haven't. Turns out it doesn't have any brakes and
I would tow it that far without brakes. Also, we are
still up in the air about launch site. If we do launch
in Burns Junction we will not be going to Bruneau.

We'll have a Mission control at the park. I just talked with them,
they'd like to have it indoors and have use project images on the
wall with their LCD projector. They're very excited about the launch.

I think Jeff volunteered to operate MC, but I don't recall for sure.
We need to make sure we have enough people (6?) to safely
launch the the stack.

Sounds good. The construction is done. Not sure where
you are located but the easiest way is to hit Ustick,
go west on Ustick to Locust Grove, turn north (right
if heading west). Paradise Ln is about a half mile on
the right, we are the third house on the left.

If you are talking about the Steel Reece (classroom) by the observatory, we have a TV separate from the projector, and VHS and 8mm VCRs available. I could even come up with two projectors, if that was needed.

There may be a problem with elevation placing mission control there. The observatory and Steel Reece building are in a depression about 60-100 feet lower than the surrounding terrain. Cell phone coverage is poor to non-existant near the building and observatory. I don't know about 2m.

How big is the Snake River group's trailer? I'm coming from Twin Falls, and might be able to transport it to Bruneau.

Rick

3971. Helium

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-06 01:49:31 UTC
From: John Knapp
Topic: 3965 Message: 3971

Paul and I have figured we will need two full tanks of Helium for the launch. We will leave the partials in Boise, so Mike, please pick up two full ones.

Remind them that Paul will be there Monday to pay for everything, so if you need welding gas go for it....

We are looking at a launch from between Grasmere and Riddle, with a landing north of Highway 20, west of Corral. We can stay the night at Bruneau Dunes and will go south on Highway 51 for the launch. We will have to leave at 4am if we launch at 6am.

We will able to do ATV since the flight will be within six miles of the Park.

We will not have a eating meeting, we will meet around 7:00pm at the Picnic Shelter at the park. Look for the telescopes.

Paul will be down there about 4:30 or so.

Thanks
JohnK and Paul

From: Jeff Melanson
Topic: 3973 Message: 3973

Hi all,

I've caught up on reading a large amount of email and I'm a little confused. I didn't get a clear picture as to what the plan is so I'll tell you where I can help. I plan on coming to the observatory Friday and spending the night. I won't be able to chase so I will help with mission control. I will be leaving around 1 or 2 pm on Saturday. That should be plenty of time for the flight.

It wasn't clear to me what will be flown or what the capsules weigh or even what size balloon is to be used so I am unable to help with predictions.

I will have my tracking equipment with me. If you want me to use my equipment for the tracking station I need a 110 volt outlet. I only have my magnetic mount antenna that I use on top of my truck. I have no idea where we would put that. Keep in mind it has a short coax, maybe 15 feet. Perhaps one of you has a better antenna setup. Rick said we will be in a hole and therefore we may have problems.

Someone mentioned a projection screen. I have no idea if my laptop can interface to it since my only comm. port is used for the TNC. The printer port is open. Does this require some software? Perhaps someone has a laptop that will do the job.

Jeff

Sounds good, I plan on being in Bruneau by 6pm at the latest....got a class at work to attend, yay!!

See ya tomorrow!

Mike KC7DPD

3975. 2 M from Bruneau

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-06 04:18:54 UTC
From: Russ Dunn
Topic: 3975 Message: 3975

Rick & Gang,

Here are some ideas when transmitting from remote areas, possibly marginal. 2M from Bruneau could be a little spotty into 147.24. The park HQ is in a depression with low hills surrounding it. However, I have gotten out with a handheld at the foot and especially at the top of the sand dunes, which is more open and almost line of sight.

1. You might take a yagi 2M beam antenna if anybody has one. A 35' Radio Shack push up pole sits nicely in the stake of a pickup bed. The signal might have to be "bounced" against an opposing hill. Remember it's FM(agic).

2. Another option is to set up a crossband repeater. Park a vehicle out in the open or on top of the hill. Use 147.24+ on one side and a 440 simplex frequency on the other. Caution: don't run the radio until the battery is dead. The Snake River ham trailer might house such a setup if it's fairly secure from vandalism for a Friday night.

3. There was a repeater NE of Mtn Home on 147.34 . As I recall, the park is shaded from the repeater by mountains.

4. Lastly, ask the State Park how they get out on their radios. Be prepared that they may not know their own frequencies or repeater sites. But they might know the hot spots where they can get out.

Hope that provides some useful options. It would be interesting to hear the results.

Russ

Subject: Re: [tvnsp] Mission Control

There may be a problem with elevation placing mission control there. The observatory and Steel Reece building are in a depression about 60-100 feet lower than the surrounding terrain. Cell phone coverage is poor to non-existant near the building and observatory. I don't know about 2m.

Rick

I can. I will have my tools at the observatory. I'll try to be there
late afternoon, and check in at the star party and observatory.

Bring your schematic.

Rick

Can't say for sure, but some of these projection screens utilize the monitor port where you'd plug in a monitor to the laptop instead of using the laptop's own screen. If that's the case, you should be fine and not need any software, but only need to plug it in and possibly select the screen mode (Fn F7 on my IBM laptop cycles thru LCD, external, both).

As for antennae at mission control, another possibility is to use a wheel base (park the car on the base and drop the mast in the tube) and j-pole with that RS mast mentioned in another post. It's probably already too late to get this to anyone, but I have these two if you want to borrow them. I also have a homebrew 20' or so mast that works well with the two. I'll try to check here in the am in case anyone wants to swing by Nampa and grab them. I trust you guys to return them.

110 VAC is pretty easy to find around the park.

> I only have my magnetic mount antenna that I use on
> top of my truck. I have no idea where we would put that.
> Keep in mind it has a short coax, maybe 15 feet. Perhaps one

> hole and therefore we may have problems.

I've got a 20' section of RG-58 A/U, and a barrel. That should allow us to get the antenna outside, and on the roof. If someone has an antenna with some gain, on a 15'-20' pole it would work MUCH better. I'm not sure what you will have for repeaters in the area.

Another possibility is to put mission control in the visitors center which is much higher, but still near river level, with tall hills marking the old Snake River banks. (Bonneville flood era.)

Both the observatory and the Eagle Cove campground (site of the star party) are in the lowlands of the park.

The projector plugs into a VGA connector, which is pretty common on laptops. (the 15 pin connector, the same size as a 9 pin serial connector)

I will have my laptop there and it does have a VGA output, a single serial and about 1GB free drive space. It is a 233MHZ pentium. If it is needed, bring software. I'm using it for astronomy, and I have Street Atlas 9.0 on it. No APRS. (Yet)

The trailer could be kept at the observatory Friday night, where it
would have someone watching it all night.

Thanks for the help, Rick. I imagine the roof is made of aluminum.
:(

We need to see what the state parks plans for us. I imagine they
plan to put us with the ISP. Have you seen their poster on the
launch?

> > Someone mentioned a projection screen. I have no idea if my

I talked to Wes yesterday. Setting up the laptop at the classroom
appealed to him. He'd like to see us project the maps and data.
Like Rick was saying, they do have a projector there, and if there's
a problem, Rick will have a spare projector (or two). Man, I gotta
me one of those projectors.

The presentation I have is on Power Point. I plan to connect my
laptop to their projector. If that fails, I have the presentation on
diskette.

Rick, thanks for having soldering equipment for Justin. I'm already
at school, so it's too late for me to pick up my stuff.

Welcome back. I am sure Paul will catch up with you on the flight but we are planning to do a hot launch from Highway 51(?) between Grasmere and Riddle. We are having difficulties with the prediction, Paul and I spent several hours last night working up some different scenerios for the launch. We are hoping the balloon will land somewhere in the vacinity of Highway 20 west of Hill City. It is sounding like we will have plenty of help with Mission Control, we need to have an idea of who can help launch and chase.

Deb and I will be down there in time for the 7:00pm meeting.

Welcome back, Jeff. I hope it all went well.

There's a chance of rain tonight. Tomorrow should be partly cloudy, there is no mention of rain.

Can anyone get Bill's antenna before they leave?

I plan to put the capsules on the launch stand during the presentation.

Jeff, can we use you mini-capsule as a backup tracker for the launch?

I've got a phone card for John the Younger and a Thermochron for Jeff.

Paul

Group,

Well, I hate to say this but I cannot make the launch this weekend....my truck was involved in a fender bender this morning at 7:00am, so I will be very busy dealing with the insurance company and all that fun stuff today! I will be able to help out tomorrow from home if possible with predictions and the like if need be.

Someone still has to pick up two tanks of helium from Sheehan's today!

Sorry guys.....

If that's mine, I'm at 809 Davis Avenue, Nampa. Right near the Lion's Park, about a block or two west of the pool. We face Poplar instead of Davis, but the house has a chain link around it, is on the SE corner of the intersection of Davis and Poplar, and has a yard sale going. If I'm not there, I'll set the stuff out and my wife or daughter will be able to let you get it.

I'll check in here again before I take off, in case there are any questions.

How close is the proposed launch site between Riddle and Grasmere to the Saylor Creek range? I don't have any aeronautical maps of the area, but remember giving weather briefings frequently to B-1s and B-52s into southwest Idaho (I was stationed at Fairchild near Spokane for three years).

Took a quick look at the winds - still forecasted to be 100-110 knots. The low-level winds up to 10-15 kft are pretty light though.

Bill,

I live just a few miles/minutes from you here in Nampa (I'm over by Micronpc) and probably can grab that mast stand and the other stuff mentioned. Not sure about the 20 ft mast though unless its colapsible. I drive a 98 Blazer just to give you a sense of the space I have. Is Hans or you going to be around? When is a good time? I still have to run over to Randy's at about 3pm today to grab some gear also.

I'm trying to search these sectionals for restricted airspaces. Jeff,
do you know where I could buy aeronautical charts at the airport?
I'll pick up one on my way to Bruneau.

This is Mark's message. We need to look into this before we
launch.

Paul

Found a site with sectionals available

http://www.aeroplanner.com

Grasmere is in the Jarbridge MOA and Riddle is in the Owyhee MOA. There are a couple of restricted areas WNW and ESE of Mountain Home, but I don't think this flight takes you through them.

Also not sure what the rules are regarding flights through MOAs or restricted airspace. Since you're under Part 101 limits, it may not matter.

From: BLOHM,BILL (HP-Boise,ex1)
Topic: 3973 Message: 3999

Justin,

Mast is in four sections, about 4-5 feet each.. I'm thinking of heading out for some lunch with a friend in a few min (it's 1220 now), but any time you want to swing by you can. Hans may be around, and if not, I'll make sure that my wife and daughter know where the stuff is, and it'll be out and readily available on the porch. I'll let them know you're planning on coming by.

Bill B.

From: Jeff Melanson
Topic: 3996 Message: 4004

Paul,

I will be bringing my capsule and it is flight ready if
needed. If your flying your ATV capsule then you may already
be at the weight limits set by FAR 101.

Subject: [tvnsp] (Fwd) Re: Saylor Creek

I'm trying to search these sectionals for restricted airspaces. Jeff,
do you know where I could buy aeronautical charts at the airport?
I'll pick up one on my way to Bruneau.

This is Mark's message. We need to look into this before we
launch.

Paul

Found a site with sectionals available

http://www.aeroplanner.com

Grasmere is in the Jarbridge MOA and Riddle is in the Owyhee MOA. There are
a couple of restricted areas WNW and ESE of Mountain Home, but I don't think
this flight takes you through them.

Also not sure what the rules are regarding flights through MOAs or
restricted airspace. Since you're under Part 101 limits, it may not matter.

4008. Antenna Mast

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-06 20:20:31 UTC
From: kd7pit
Topic: 4008 Message: 4008

Hi all, I just got Bill's antenna mast so I'll bring that along. I'll be leaving here about 2:30pm to head for Ontario to get Randy's computer and then to the Wal-mart next to him to pick up some batteries. I never been to the dunes before so where are we meeting at? Is there a visitor center or something? I will be monitoring 147.24 if anyone needs to get a hold of me and vice versa. See ya all there!

Justin, KD7PIT

Justin, there's a visitor center just after you enter the park. The
ranger at the entrance can give you directions from there.
Basically you'll drive another mile or so from the entrance to the
camp sites. We're at the new site, the one without trees. There
will be a BAS sign near the shelter where you can sign in.

We'll meet at the shelter.

4014. TV02F Flight Prediction

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-07 00:25:25 UTC
From: Mike Garske
Topic: 4014 Message: 4014

Group,

I have a prediction I ran with this mornings soundings, 6 Sept 2002 12z.....here's what I got.

Using 1300 fpm ascent, 1200 fpm descent, 85,000 burst

124.2 Miles Bearing 28.6 degrees.

I talked to John the Elder today, and he said it looks like they will launch from a place called Saddle, between Riddle and Grasmere on Highway 51. If this prediction is true and the winds hold up, that will put the balloon down east of Atlanta up in the mountains!!

Can anyone confirm my fears???

Mike KC7DPD

From: K7JPS - John
Topic: 4015 Message: 4016

The only one I can confirm is KD4STH-11, it is the only one that Paul listed on the configuration page. There has been some talk of Jeff running his Arctic Chill capsule which would be KD7INN-11, but there is nothing definite on that one yet.

I decided to watch this one from home as well. It has been a rainy afternoon, and I think that the star party tonight is going to be a disappointment with the cloud cover. It should start clearing tomorrow for a nice view Saturday night.

4018. Re: [tvnsp] TV02F Flight Prediction

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-07 02:55:30 UTC
From: Mark Conner
Topic: 4014 Message: 4018

This is about what I was seeing earlier today. I did some quick and dirty predictions using tomorrow's forecast winds and got a bearing of about 020 and distance of between 95 and 125 miles (depending on ascent rate). Burst altitude will make little difference to overall track distance unless it happens well below 60kft.

Good luck tomorrow - sounds like it could be a sporting recovery in the forests north of US20.

Mark, thanks for your help. We are currently having a discussion of flying Jeff's Arctic Chill again. It would be the same configuration as TV02D, and launching it from the State Park. This was a 2.3 lb package (capsule and chute) under a 200g balloon. It might still be a hot launch with an ascent rate of 1500fpm, which liftwin predicts a 33000 burst. This would be under the call KD7INN-11.

4032. 200 gram Kaymonts may burst much higher than expected

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-07 16:09:01 UTC
From: n1ltv
Topic: 4032 Message: 4032

The TV 02D flight that landed near Midvale went
much higher than predicted.

If today's does similar, we can probably conclude
that they are rated too low by Kaymont.

Hank

Looks like touch-down will be about midpoint between Trinity Lakes and Pine.
Hope the recovery team has their mountain goat shoes on.

I love to hike and backpack in the mountains, so I wish I were there right now in the Sawtooth hiking up the Dog Creek if that's possible for the distance required to reach 02F.

> the balloon was a little hot today!!

It should have been hotter still unfortunately. If I had known a 200 gram was going to be used I would have advised adjusting upward the burst height based upon Jeff's 02D experience.

> By the way, do
> you still have Liftwin 0.3 available?

I was going to get around to that after doing some of these maps. It's been here all along:

http://www.geocities.com/n1ltv/newliftwin.htm

/n1ltv is equivalent to /CapeCanaveral/3161 but is much eaier to remember.

Hank

4045. TV 02F final reported position on topo map

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-07 17:58:37 UTC
From: Hank Riley
Topic: 4045 Message: 4045
Attachments: 1 described; binary payloads are missing from this source WARC

The approximate elevation under the last reported APRS
postion (7300 feet) is 5700 feet. The elevation of Dog Creek
in that vicinity is 5500 feet, and the road that follows the
Boise River passing Dog Creek Campground is 4400 feet.

Note the .7 mile map scale marker in the lower left.

Correction: lower right.

4048. Topozone map

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-07 18:21:34 UTC
From: Mark Conner
Topic: 4048 Message: 4048

http://www.topozone.com/map.asp?z=11&n=4822308&e=633649&s=25&size=m&u=2

The crosshair is at the last position. The last few positions of the balloon indicated a course of about 020 (the GPS course/speed may have been affected by payload swinging, a spiraling chute, etc), and extrapolating that for some additional distance downwind would indicate the landing is perhaps 150-200 yds to the NNE of the 7283' position.

(I see Hank has posted while I was typing)

This map also shows a trail looping around west of the landing site. However, since it appears the balloon has landed in the Dog Creek valley, it may be an easier hike to start at the campground and work NW. The landing is about 2.5 miles from the campground.

From: Hank Riley
Topic: 4050 Message: 4050
Attachments: 1 described; binary payloads are missing from this source WARC

This is the 12 UTC Saturday AVN model analysis plotted.

It shows how the 300 millibar (~30k feet today) winds are
right over Idaho, making it the windiest region (including
a few nearby states) in the United States at jetstream
level. It looks like the very peak of the jet is lined up
over the Idaho western border.

The winds were actually just a little stronger a little
above 30k feet altitude today in Idaho.

Thanks Hank.......yeah I wish I was there too, but I had a major event happen yesterday, and I had to stay home.

Looking at the data though, it looks if they get within a mile of the balloon, they should pick it up on APRS. If not, the last report position is pretty close to the ground out there.....they should be closing in on it soon, I suspect.

> closing in on it soon, I suspect.

Mike,

I keep thinking of lots of trees. A hike such as this
in mountainous New England terrain would be very time
consuming and difficult due to dense forestation.

Do you have any idea of what this terrain would look
like? Could it be anywhere as easy as Indian Head was
over the Snake for 02E?

By the color coding on the topo maps I'm assuming there
will be some trees, but just how thick I'd have no idea.
I hope there will be pictures of the Dog Creek area for
you to post even without your being in the chase today.

Hank

4053. TV02F Status Update

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-07 19:18:26 UTC
From: Mike Garske
Topic: 4053 Message: 4053

Everyone,

At 11:33am MDT, the chase crews reported they were 6 miles South of Pine, near Anderson Ranch Dam. They reported there was foggy and a little rain in the area.

In case everyone does not know, we flew a 200g Kaymont balloon, with a 2.3lb payload that was only a tracker.

Watch for more updates at the website www.tvnsp.org

Hank,

I am not sure if anyone brought a camera for the chase, I hope so too.
This area is covered in pine and Douglas fir trees, so it will be a
challenge to say the least. It is a complete 180 degree change between what
Indian Head Mountain gave us!

4055. Positive Lift!

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-07 20:00:30 UTC
From: Mike Garske
Topic: 4055 Message: 4055

Hank,

For your information, the balloon had 10 lbs nozzle lift, and the highest reported altitude was 46,150 ft. It was a 200g Kaymont. (you know that already!) The payload weight was 2.3 lbs.

Mike KC7DPD

4056. RE: [tvnsp] Flight 02E Nozzle Lift

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-07 21:40:11 UTC
From: K7JPS - John
Topic: 4005 Message: 4056

Jeff and Hank,

For TV02D we had a Kaymont 200g my check list requested 5.3 lb of nozzle lift. But like Jeff said, we overfilled the balloon, I didn't write it down, but seem to remember 5.7 lb of nozzle lift. Since I am not certain of the nozzle lift, I don't feel it is accurate enough for Hank to include in LiftWin, but it does support the theory that Kaymont's numbers are skewed for this balloon. The burst altitude was 52,503 ft. and the total payload weight was 2.3 lb.

I'm beginning to think that I need an additional column in my launch manifest to record predicted vs. actual variables.

John,

Even an approximate fill figure will be better than leaving
the Kaymont numbers alone as they are now. By using the
results TVNSP is getting, predictions can be improved
considerably for the 200 gram Kaymont performance.

Thanks to you and Mike for the lift info.

Hank

4058. TV02F Initial Recovery Report

The free lift of the balloon was 10 lbs. It was
supposed to burst at 25,000ft. It didn't, going to
44,000ft. To say that Kaymont's numbers are skewed for
this balloon is an understatement. It would also
appear to me the quality control (consistancy of
manufacturing) is also skewed, or better said - nill.

There was a camera on the hike. Justin had it.
Hopefully when they catchup on some much needed sleep
the pictures will be posted. The terrain was basically
up and down, the slopes where at times 60 degrees on
highly eroded granite.

4061. Accident

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-08 16:40:46 UTC
From: John Knapp
Topic: 4042 Message: 4061

I believe I need to let everyone know what happened yesterday afternoon. Deb (my wife), Justin, Paul and I headed after the balloon. Not being as agile or as young as the two mountain goats, Deb and I only covered about an mile and half and waited for the other two to retrieve the balloons. Both groups had HT radios. Going through Pine, the two cars were using Simplex for communications and we happen to have a call from a Ham in Pine. He invited us to stop in for a minute, we talked to him and told him what we were doing and were we were headed.

Back to the chase. When Justin called us that they had found the balloon but could not retreive it, both groups started to head back to the cars. About a mile from the cars Deb fell down a ravine, badly hurting her right knee. Believe it or not, the Ham in Pine was monitoring most of our transmissions, called me (I was still in the ravine), and was able to get help to us. Both Paul and Justing hiked out and were able to lead the recue personnel to us. We made it out right at dusk, about 8:00pm. Deb was taken to the Mt. Home Hospital for evaluation and released. No broken bones, but possible torn legiments. We did not leave the campground where we had parked the cars until about 10:00pm. If no word was received from Justin and Paul because we couldn't get word out until we were back in radio range.

I got home at 2:00am this morning. I got a phone call from the Pine Ham, KG7CN, at 10:00 wondering how Deb was doing. Really nice to have that concern.

I guess there are several lessons learned here. If we leave our vehicles to retrieve a balloon on foot we make sure we are properly equiped. That includes an HT radio in working condition, flashlight, and matches at a minimum.

I wonder what the odds were of finding an Amatuer Radio in Pine, Id. And that person was able to track our communications doing the afternoon as we were walking up the canyon, deep in the radio mts. I was able to comunicate with him while in the ravine. Someone was looking after us.

If I seem angry at Kaymont for inconsistancy in their balloons I believe you will understand it now. Paul, Justin, Jeff and I, with help from Mike and John the younger, spent a lot of time crunching numbers to make sure the balloon would not enter the Jet Stream. We seemed to be doing everything right. Delayed the launch to get the latest info, etc. Oh, and a thanks for Mark for the information on the bad data above 34,000 ft.

Wow! So I guess you don't want to hear about our recovery where we drove 1/3 of a mile along a railroad service road and walked 300 feet through an open gate to pick up our package? :-)

I hope your wife is doing okay. I think your suggestions for survival equipment is a very valid point in a location such as yours..

4063. Kaysam balloons

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-08 17:02:47 UTC
From: Zack Clobes
Topic: 4063 Message: 4063

Don and I both flew Kaysam balloons yesterday - 600g for PT, and 1200g for HABITAT. I never saw Don's remains, but ours definitely did not shear off at the ring as Mark had found on his experiences. We brought the better part of the 600g back with us. Maybe Don can comment on his luck.

The only thing that I noticed was that our 600g had a slight bulge that seemed to be forming on one side, similar to the "premature burst" at GPSL this year. It didn't seem to affect performance though.. we attained our expected burst altitude. My camera batteries were dead when I got there so I didn't get a picture of the bulge - Don did any of your people happen to capture that moment?

BTW: Project: Traveler's flight analysis is now posted at www.rckara.org/project_traveler/ and I am scanning the aerial photos right now.

Attached is a photo of what I got back for my 650g balloon launched in late 2000. This is about 20-25% of the original. Note too the substantially darker color of the Kaysam balloon - it is more of an olive green/brown rather than a light beige or off-white.

From: BLOHM,BILL (HP-Boise,ex1)
Topic: 4042 Message: 4066

I'm really sorry to hear what happened to Deb, and am glad it turned out OK in the end.

I always have a knapsack with me when I hike out that has that and a little more in it. Some other things I would add to your list is to get something like a few (I carry 4) 151 Energy Bars (a fruit bar that's not only good tasting but also does provide energy), water, 100 feet or so of parachute cord, and a knife (preferrably something like the Leatherman). Rather than a flashlight, I carry a candle lantern. All this is lightweight, but valuable in such a situation. I need to add an emergency blanket to my pack, I keep forgetting that. Any time you go into territory like that, or hike out from our vehicles at all during a chase, I agree with you, John: we all need to be prepared for the possibility of having to spend longer than you want or being able to support someone else.

I've been thinking of the radio issue. Here's some random thoughts of mine. The key here was KG7CN. Unfortunately, as you imply, we can't bank on that kind of luck always happening. My first impulse, based on the fact that being deaf I think PACKET, was portable digis that could be dropped along the trail in a situation like this where two remain behind part way and the rest go on. Keeping a very frequent radio check going, you'd learn where to drop the digi. I wonder, can we similarly do a repeater drop? I'm assuming, of course, that the party that goes on will come back the same way and so recover the drops. The bad part of this, obviously, is the need for more gear to alway be carried along on the chase.

From: kd7pit
Topic: 4067 Message: 4067

Mike,

I have finished moving the photos from the digital cam and placed them on a file on my computer. My question to you is how to send them without jamming up your email. I have 44 photos that equal about 2.8 mb. I can send them a few at a time in separate emails or all at once, your choice. I didn't take any more photos after we found the capsule because I was very tired by then and events started to get more serious so no time to snap photos, plus it was dark by then. I did get a few good photos closeup of the capsule dangling at the top of the tree. The sun was over-head so you see more of a silhoette rather than colors but you can see it non the less.

There were 18.6 miles between the starting point for both balloons and SkyLab's last igated position, and for Traveler it was about 14 miles. The last positions igated were pretty close to the landing points.

Randy,

Sorry I couldn't get your computer back to you before you had to leave today. Didn't get home til 2am then I slept til 3pm, ya I was tired. Anyways, the computer worked great and I believe I was seen all the way up to where we went into the mts. I'm going to look and see if the TNC log is all there here in a minute. As for your camera, that thing is awesome. THe battery lasted forever and I believe it was the only camera that caught the whole event. Thanks again for your support and I'll try to get your stuff back ASAP.

Hey Justin, just ship all the pictures to me, 2.8 MB isn't that bad to wait for! Just send it directly to my email: kc7dpd@...

Hope you are still resting up from the hike in.....that didn't sound like a fun hike!

I will get the pictures posted by next week.....

Justin,

One possibility is to upload it to the TVNSP file area
at yahoogroups.com.

The advantage to that method compared to mailing it to TVNSP
as an attachment is that some people may not want even
a moderately large file coming into their email accounts.

I have written recently an APRS file extractor that will
clean up your log in a jiffy (I'm using it to produce these
fast balloon track maps). I know Mark also has a program
he found to do file extraction work.

Justin,

Ditto what Hank said. Upload it to Yahoo Please. I don't know if Mike is making these logs part of the website or not. Maybe he would want a cleaned up version. One thing to watch out for is that the cleaned up version won't have time stamps because the Tiny Track II doesn't transmitt time stamps (a major drawback). The raw data would have time stamps from other stations that would give us estimates of when things happened.

4079. Capsule Retreival

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-09 04:50:16 UTC
From: Jeff Melanson
Topic: 4079 Message: 4079

Hi all,

Today I meet with Paul and John and Deb. We talked about what it would take to retrieve the capsule and made preliminary plans. Later I meet with my brother-in-law and we studied his Delorme Topo Map. There is a much easier way to get into the area than the path the chase crew took. We don't have to do much hill climbing or descending. John Knapp is making reservations at Jade Garden for this Thursday to discuss the flight and detail retrieval plans. I will bring the Delorme Topo Map information. Currently we are thinking that we would drive up to Dog Creek Campground on Friday and stay the night. The next day we will hike in with the needed equipment.
The capsule is hanging from a tree about 50 feet up. Paul suggests we use a 50 to 60 foot pole to snag the parachute. We would carry the pole in in sections and assemble it there. Anybody else have any suggestions?

Jeff

Here's the cleaned up log that I extracted last night.

So far I have generated graphs on the altitude and ascent rate.
Tonight I'll gen a graph on the wind speeds. I made the
assumption that packets were sent every minute. When I graphed
the ascent rate, there were some anomolous spikes in the data.
After a moment, I realized they indicated where packets hadn't
been recorded. The height of the spikes also indicated how many
packets were lost. I made blank enteries for those packets (don't
create data) and the curves were much smoother. I'll email the
completed spread sheet file tomorrow.

Paul

I hope Justin's pictures will help make the situation a little more clear.

I pulled 5 pieces of 1/4" fiberglass kite rods out of storage. they all have a length of 4 feet, so taping them togather will get use close to 20 feet. I recommend we make these light poles the end of our recovery pole. One person can easily pack them in. The bottom of the pole should also be light, perhaps 1" diameter aluminum. We may also want some additional poles, 10 to 20 feet long to act as fulcrums for the main pole.

It looks like that trail that Mark and Jeff (and Hank?) have pointed out it a better way to get to the capsule than the one Justn and I took.

Our trail in was very steep and rocky. We kept slipping as we made our way in. The terrain is so rough that we walked for about 3 hours just to cover the 2 miles to the capsule. In most places you can't walk at a constant elevation, there's a lot of ups and downs. The foliage and rocks also make it very difficult to get around. Justin took a couple of pictures on our way in, they'll give you an idea of what we're up against.

The trail we'll take will allow us to keep a fast pace towards the capsule. The one mile we have to cross over land is mostly downhill, so that should also help. We should still plan to spend the better part of the day getting to the capsule and back out again. Someone should be positioned at the end of the trail and be left with a radio. We'll need to carry in GPS recievers and should try to place survey flags as we go. Our ham friend in Pine should also know what we're doing.

My estimate is that the tree is 50 feet tall and has a trunk of 3 feet in diameter. Is anyone familiar with ponderosa pine? Does a 3 foot diameter trunk make sense for a 50 foot tall tree? Last night I went for a walk and found a tree n the neighborhood that I thought was the same size. I walked out until the tree's top was at about a 45 degree angle and paced the distance tot he tree. It was roughly fifty feet, giving me a little more confidence in my estimate. As for our tree, there's one branch that's reachable from the ground. But the next available one is on the other side of the tree, so you can't reach it. The capsule is suspended very close to the top of the tree. It's hanging vertically from the parachute and is located on the outside branches of the tree. The capsule is not buried deep within the branches. You have to stand away from the tree to be able to see it. From my vantage point up the mountain (about 50 feet above the base of the tree) it's easy to see.

I have three tree spikes. Does anyone have a few more? Can we get a harness for climbing the tree? How about a rope? Even if we can't get all the way up, someone still may be able to use the pole to knock the capsule loose.

Another option is to bring a 30 pound bow. We could shoot an arrow with a cord (like you would do to set up an antenna in a tree) between the branches and then pull on the cord to pull the capsule out.

I really think we can pull this off and save Jeff $300. Besides, it would be an awesome adventure for a near space group to accomplish.

Any other ideas or getting the capsule out of the three?

Paul

May apologies for the shotgun approach to sending this. I'm trying to hit as many of those birds with this rock as I can. ;-) I didn't do a very good job of notifying everyone, missed some lists etc.

I did my typical quick patch. I'm working on a new page so I can stop this mess. (habitat.netlab.org)

I posted two new items to the top of my web page - a photo of the Kaysam remains as requested - the graphic Ralph made of the 2 SR (Simplex Repeater) QSOs (2nd & 3rd place distance records).

I am working on redoing my web page, sorry for the mess. If you let the page load to the new email list note you should have the two links just above it. You could then click STOP and not load the rest of the page. I cropped the photo a little but haven't made the picture web (slow connect) friendly. I'll try to make progress on this today.

73 for now.

Another option is to bring a 30 pound bow. We could shoot an
arrow with a cord (like you would do to set up an antenna in a tree)
between the branches and then pull on the cord to pull the capsule
out.

I was thinking about this the other night as a means of retrieving a payload out of a tree. If you were able to put the arrow through the shroud lines so you could pull on it, you should be able to bring it down. You may also be able to drag the line across the branch and pull it off, too. You'd need a couple hundred feet of line (and more as a backup in case a miss gets permanently caught) so you could pull down on both ends.

This and the pole seems preferable to climbing a few tens of feet into a tree in the middle of nowhere in Idaho (and potentially falling out of said tree). The main concern I would have with a taped-together pole is being able to tape it securely enough so that it won't bend at a tape splice. Definintely worth testing prior to a day hike.

I'm begining to like this idea best of all. Where's Robin Hood when you need him?

Mark's idea of testing the pole is a good idea also. Perhaps we should meet before Thursday to try it out. Can we meet at someone's house to try it?

As far as falling out of the tree, There's a grassy meadow that's probably large enough to land a Life Flight heliciopter. But let's not do that!

If the capsule had drifted five feet away from the tree, it would have landed in the open.

No problem Justin.
I did not need it Sunday. I had my Palm for programming, it is just slower to use than a laptop. I figured you would be in no mood or shape to return it after such a late return Sat. Never had time Sat. to view the event "live",I only reviewed the tracks when i got home in the afternoon.
I always have an alternate backup plan when going to remote digipeater mountain sites. Glad i could help in some small way.

I'm just sad that the group had an injury trying to recover the capsule.
My hat is off to Deb for being such a sport. She is an inspiration to all of us at every balloon launch with her enthusiasm attention to detail.
Hope this incident does not squelch her enthusiasm for future launches.
John is another one of us lucky men to have such a rare woman.

Score this as another learning experience whether it be good or bad.

>>> J_Formolo@... 09/08/02 06:34PM >>>
Randy,

Sorry I couldn't get your computer back to you before you had to leave today. Didn't get home til 2am then I slept til 3pm, ya I was tired. Anyways, the computer worked great and I believe I was seen all the way up to where we went into the mts. I'm going to look and see if the TNC log is all there here in a minute. As for your camera, that thing is awesome. THe battery lasted forever and I believe it was the only camera that caught the whole event. Thanks again for your support and I'll try to get your stuff back ASAP.

Justin, KD7PIT

You can practice the pole technique here if you want
to, also the Robin Hood shoot if you want. We have the
space to do that. Need to give me a little notice
first to make sure I am here. I have to make a run to
Mt. Home to pick up Deb's X-rays, not sure when yet.

I do agree we need to make sure everything works okay
prior to going up to Pine and hiking. It is a pain to
realize 'Darn I forget to get this....'. :-)

I have reserved some private space at the Jade Garden
on Thursday night at 6:30. No issues there.

I would like to thank everyone for their words of
incouragement. Both Deb and I appreciate it.

Thanks. Lloyd made a suggestion we use an extending tree saw.
I think I've seen these. Can one reach 50 feet?

How about a wire saw? Shoot a line over the branch the payload is hanging from, pull a wire saw up into position, saw off the limb.

I wanted to share this with the group. Here's Lloyd's idea, and I think he's onto something. What do we have collectively that would make this work?

Paul

One more idea for you - combo tree saw and antenna mast

take several 10 foot sections (I would get 6 or 7 for the estimated 50 foot height you need) of the antenna mast's you can buy almost anywhere (Home Depot, Trash Shack, Lowes, etc). Also buy / borrow / steal a tree saw blade. The blade mounts to the normal handle with a couple of carriage bolts, so just drill one of the mast pieces with the right size holes, and mount a saw blade on it. Then add pieces as necessary to reach where you need to.

These are also pretty light to carry, and 10 foot lengths shouldn't be too bad for the trail

Lloyd

The idea of a tree saw is good, however, from
experience with the same "brainstorm",
I put one together in the same manner using top
rail from chain link fencing that had been cut
into 7 foot sections for portable antenna masts.
This was to trim a limb out of a friends tree that
was tangled in his beam.
We only had to get up 30-35 feet but there were
problems.
The length was too flexible, you had to tie a
couple of ropes to the apparatus in
order to "boom" it up like a crane. Once we had
the saw on the limb, the flexibility
of everything made it very difficult to hold the
saw straight, and attempting to actually
saw only made the limb sway, and the long length
of the saw sway even worse.
After that experience, I won't use that method
again at those kinds of heights.
I shudder at trying to stick 50 feet up in the air
like that.

4098. Re: payload extraction

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-09 18:55:00 UTC
From: n9xtn@cox.net
Topic: 4098 Message: 4098

Ref. the tree saw option:

Can enough force be placed so that the saw blade will actually cut? Also worth testing on a 50-ft high limb before departure.

Also, most tree limb saws I've seen are D-shaped, with the blade forming the straight part of the D and attached by the blade's ends. If you just attach the blade to the side of a TV mast, then there's no way for the blade to go any distance into the limb - the mast will get in the way. I suppose you could drill another hole near the center of the blade and attach it to the top end of the mast, leaving about half the blade extending off the top. Then you could cut with the top part of the blade, if you can press it against the limb hard enough.

Can someone post a photo of the payload in the tree so we have a common frame of reference? Is the payload caught in a single branch, or might it be caught in several?

I have three tree spikes. Does anyone have a few more? Can we
get a harness for climbing the tree? How about a rope? Even if we
can't get all the way up, someone still may be able to use the pole
to knock the capsule loose.

I don't think the "Tree Huggers" approve of this method of climbing
trees anymore ;-)

Another option is to bring a 30 pound bow. We could shoot an
arrow with a cord (like you would do to set up an antenna in a tree)
between the branches and then pull on the cord to pull the capsule
out.

I have the bow, equipment and the experience to perform this task.
My problem is a prior commitment for this Saturday.
Does anyone in the group know how to handle a compound bow?

One other idea along this method of retrieval.
Im not as familiar with the performance ,but would the wrist-rocket type
launcher work?
This is the safer and eaier method of hurling a projectile
connected to a trailing chord through the air at a target.
Near misses are not as apt to endanger the target or the marksman.
I'm thinking of the type that uses a large closed face spinning
reel to hold the twine. Not sure what their yard capacity is since
i never owned one. I always considered this type of fishing reel
inadequate for an avid fisherman, but in our case,this might be perfect.

I really think we can pull this off and save Jeff $300. Besides, it
would be an awesome adventure for a near space group to
accomplish.

Any other ideas or getting the capsule out of the three?

Paul

I also shudder at this idea. Every Christmas I
decorate a large pine tree with lights, and have to
use about 30 feet of aluminun pole. The sway in thrity
feet is bad, I can't imagine what it would be like for
50 ft. Also, I would encourage them to have about 80
or 90 feet of pole with them in case the distance is
judged to short. It would be the pits (no offense
Justin) if the pole was about 5 ft too short after
hiking into the area.

Also, only part of the way has a trail, the hikers
would be cutting cross country. It might be a chore to
carry 10 ft. sections of top rail - only a thought.

From: LThomson
Topic: 4098 Message: 4103

The tree blades I have seen and used have a cresent shape about 12 or so inches long. business edge of the blade is on the concave edge, so that when you saw, the blade will more or less stay against the branch when sawing on the top side. The blade attaches using two bolts on one end of the blade.

You would want to mount the saw blade on the end of whatever pole you use so that the blade extends past the end of the pole. That way the pole and blade will not interfere with each other.

When I have been using my "off the shelf" tree saw, even it's 20 or 25 feet of fiberglass polt have been a little heavy after a while. However, I have found that just the weight of the pole is enough to put sufficient pressure on the saw blade to get the job done. Even better if the blade is sharp and / or new. When I get tired, I can just lean it against the tree and rest.

One more thing I thought of - if they do not have the option already, drill the rest of the mast's so that a bolt can be inserted through each joint. That way you can pull the pieces as well as push, for obvious reasons.

And, yes, getting it up there would probably be a two person job, just because of the leverage working against you because of the length.

Lloyd

Subject: [tvnsp] Re: payload extraction

Ref. the tree saw option:

Can enough force be placed so that the saw blade will actually cut? Also worth testing on a 50-ft high limb before departure.

Also, most tree limb saws I've seen are D-shaped, with the blade forming the straight part of the D and attached by the blade's ends. If you just attach the blade to the side of a TV mast, then there's no way for the blade to go any distance into the limb - the mast will get in the way. I suppose you could drill another hole near the center of the blade and attach it to the top end of the mast, leaving about half the blade extending off the top. Then you could cut with the top part of the blade, if you can press it against the limb hard enough.

Can someone post a photo of the payload in the tree so we have a common frame of reference? Is the payload caught in a single branch, or might it be caught in several?

I'm thinking the blade should be vertical. Then all we do it pull the
blade down the side of the branch, many, many times.

> Can someone post a photo of the payload in the tree so we have a common frame of reference? Is the payload caught in a single branch, or might it be caught in several?

It looked like one branch, but there are several branchs below it.
Justin took a picture with the digital camera. Those should be on
the TVNSP website shortly.

I think you can buy these at any sport shop.

I do like the pole pruning saws for 20 feet or less,
i just can't imagine reaching up 50 plus feet,but
it never hurts to try. Maybe a tree surgeon would
have some good input.

Surprised no one brought up the easiest and most
obvious,just fall the sucker ;-) Running for my enviromental
shelter.

How about a wire saw? Shoot a line over the branch the payload is hanging
from, pull a wire saw up into position, saw off the limb.

From: LThomson
Topic: 4098 Message: 4110

I'm thinking the blade should be vertical. Then all we do it pull the blade down the side of the branch, many, many times.

Actually you want the blade to be at an angle when you cut. You don't want to be under it when the branch breaks loose. Also, if you are at an angle, the weight of the pole works for you by increasing the pressure on the saw blade. FYI, and I don't know how well it will work because of the length, but you get a cleaner cut if you do a small one on the bottom of the branch, then change over to the topside. Eliminates the bark peel that typically occurs when the branch shears off. I always try to do this on the trees I trim in my yard, but youmay not reall care about this offensive tree that Murphy put in the right (or wrong for us) place!!

The photo's should be educational!!!!

I'm coming into this discussion late but I can't keep my fingers still or my mouth shut.

Here is what I got:
capsule in tree
clearing 5' away from tree

There has been an article(s) in QST about a way to put an antenna in a tree. You float a line over it with balloons, drop the line, hook the capsule/shroudlines/parachute? This might allow you to get at it from the top if that would help any? Much like you do with the lanyard launch but smaller scale.

I don't know if this approach has any merit here. I am guessing it is a wooded area, step climbs and rocks.

What they used in QST was party type balloons, so maybe one of those party balloon kit tanks? Anyway, just a thought, I'm sure you will know instantanlty if it has any use. If not sorry for the wasted time.

Of course if there is no clearing, no good.

73 and good luck, I'll read the mail more closely as I have time.

Don

I send a photo from near space to Sky and Telescope last week.
I got an email this afternoon from them. Ms. Joson is planning to
push for the photograph to be included in the magazine. I just fax
them a submission form. I was told tomorrow is the deadline for
their current issue's photographs. Last weekend, Mr. O'Meara
(spelling?), who has worked with Sky and Telescope attended the
TVNSP presentation at ISP. Perhaps he can put in a good word
for us. In the fax coversheet, I invited them to Idaho to attend a
launch.

We'll see.....

Topic: 4068 Message: 4116

Justin,

It's about 1830 and I'm about to head home. I figure I'll be out of here at 1830, I can swing by your place and pick it up if you want. Post a note here before 1830 and I'll do that. Otherwise, I can pick it up from you sometime after 1800 tomorrow, whatever time works for you. Or you can drop it off at my place any time after 1900 tonight or after 1800 tomorrow.

Glad to hear it worked out well. I really like that setup for portability in a Geo Tracker, which is my main ham rig.

From: Jeff Melanson
Topic: 4117 Message: 4117

Hi all,

Let's think this through...

If you can get a pole 50 feet up to cut the limb then you can just lift the parachute up and out. No need to cut the limb. Paul and Justin, you two are the only eye witnesses, does that make sense?
I've been looking at my 40 ft. high telescoping antenna mast in my backyard. Even 40 feet is a long ways up. It is raised by extending it straight up one section at a time. Guy wires are use to steady it while raising it. Perhaps it could be raised next to the tree then walk it in closer. A 10 foot section could be added to it. I have reservations about this idea.
How about the Bow and Arrow idea? Paul and Justin, did it look like you could pull it out of the tree if a string were run next to it?
How about the High Limb Rope Chain Saw idea that Randy came up with. Is there a practical way to place it in the right spot? If you cut the branch will it just fall to the next branch?

Here are two idea's that I'm working on...
1) I have a tent that uses flexible fiberglass poles held together with an elastic string in the middle. The total length is 53 feet. I just have to connect the four sections. It can be raised next to the tree in sections using the tree branches to snake it through which would provide support. Sneak up on the parachute and snag it. I will try it with my 40 foot tree tonight.
2) Take sections of schedule 80 PVC pipe and assemble it as it is being raised under the tree. Same principle as above. If I have time I will run down to Home Depot tonight and see if this pipe is stiff enough.

If a tree falls in the woods and no one is around to hear it did it make a sound?

Jeff, I think you are right. Deb and I have been talking about all of the ideas that have come forward. We think sawing the branch will cause the limb to fall to the next one. Of course, I have not seen pictures of it. The PVC pipe sounds like a good idea. The pipe could be cut into five foot sections and connected with slip connectors as needed. I have never tried to move a fifty foot section, have moved 20 and 25 ft sections though. And using the tree for support to connect the pipes together would also be a good idea.

Bring extra pipe incase a section splinters for some reason.

From: Jeff Melanson
Topic: 4117 Message: 4119

Hi all,

I have tested the tent pole method. The poles are too
flexible. I was able to put 30 feet up into the tree but I
could not direct the end of it to go where I wanted it.
I could not find Schedule 80 pipe. I looked at 1/2 inch
Schedule 40. It is much stiffer than the tent poles. I'm
still not sure that I could direct the end of it to a
specific location because of the height. When you try this
you find that 50 feet is a long way to go.
I looked at paint roller handles. They had one telescoping
handle that was 23 feet long and it was pretty steady and
light weight. Unfortunately you can't join them together to
make a longer one. Isn't there 10 foot sections that you can
screw together?
The 1/2" electrical conduit looked good but I couldn't find
a way to join them together with a dependable joint. It's
only $1.36 per 10 feet. The regular conduit couplers are to
weak for our application. Any idea's here?
Does anybody have a monkey?
Paul, do your rabbits climb trees?

Randy wrote:

I have the bow, equipment and the experience to perform this
task.
My problem is a prior commitment for this Saturday.
Does anyone in the group know how to handle a compound bow?

Randy, if we can't make it this Saturday could you make it
next Saturday?

Borrowing this message for a more general response. Before you go doing too much improvising on the saw end of things go get the tool they make for the job. Has a telescoping handle and a nice curved saw blade on the end. I don't think they're probably long enough but it's a start.

>The pipe could be cut into five foot sections and connected with slip
>connectors as needed.

For safety I think I'd glue those joints. Enough primer and glue to do the trick would be minimal additional weight to carry. Take along a PVC cutter or saw and you can disassemble it. Keep in mind you'll need to pull on it to saw... Might be worth using at least one cross fitting instead of a slip union. That way you can put a guy rope through it.

>Bring extra pipe incase a section splinters for some reason.

Might as well bring some extra unions and that cutter and you can just cut off the bad ends and make a new joint. Dunno what size pipe you're looking at but 1" unions are about $0.30.

Bill

p.s. Gotta ask... Anybody know an RC helicopter pilot who wants a challenge?

I'll second that - keep us posted on how she's doing.

>My first impulse, based on the fact that being deaf I think PACKET, was
>portable digis that could be dropped along the trail in a situation like
>this where two remain behind part way and the rest go on.

It's not just deaf... In this situation at least one of the vehicles with a mobile rig in it needs to be set to digipeat. Then those in the party that have D7's (or other mobile APRS gear) can get messages out to net control. You might be able to do something similar for voice with radios that are capable of functioning as a repeater. (in many cases this means cross-band repeating) However, the duty cycle requirements for packet are much less. As Bill B. mentions a portable digipeat station could extend that range even further.

Check out http://home.earthlink.net/~wa8inz/ for the "Porta-Digi"
(Personally I'd suggest using a TV Twin Lead J-Pole for ease of carrying.)

A contact schedule should probably be arranged prior to leaving the rigs. Along with a schedule we should probably pick out a primary and backup repeater based on what we can hit easily. Generally we have enough HT's along that we could monitor several repeaters by assigning people.

>The bad part of this, obviously, is the need for more gear to alway be
>carried along on the chase.

Think of it as insurance. If you carry the gear you won't need it. <grin>

You might want to look at the bigger diameters. Even 3/4" is noticeably less flexible than 1/2"- 1" is even better. There isn't as much benefit to increasing the size once you go past 1".

You might look at the water-tight couplings. They use a compression nut on each end. I'd still be a little nervous about them but they would definitely be better than the "standard" couplings. Just FYI the conduit fittings actually have a standard pipe thread. Pipe would be heavier but could be screwed together.

Not sure where you looked but I'd strongly consider looking at Grovers Pay N Pak. Their prices aren't always the lowest but they often are lower than the big chains. They also might have the schedule 80 pipe.

Bill

4124. Re: [tvnsp] Capsule Rescue

Yahoo group: tvnsp (2000 — 2002)

From: Rick Widmer
Topic: 4117 Message: 4124

First a few thoughts on the use of a saw.

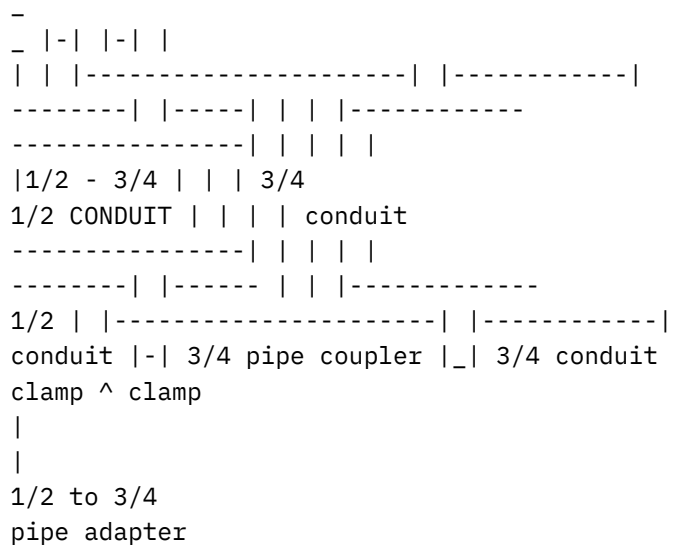
http://www.fs.fed.us/r4/boise/info/firewood.html

"You may not cut live trees!"

"Violations are punishable by a fine of not more than $5,000.00 or imprisonment for not more than 6 months or both (16 USC 551)."

Assuming the package is in a tree an the edge of a clearing, and visible from the clearing, here is what I would try first.

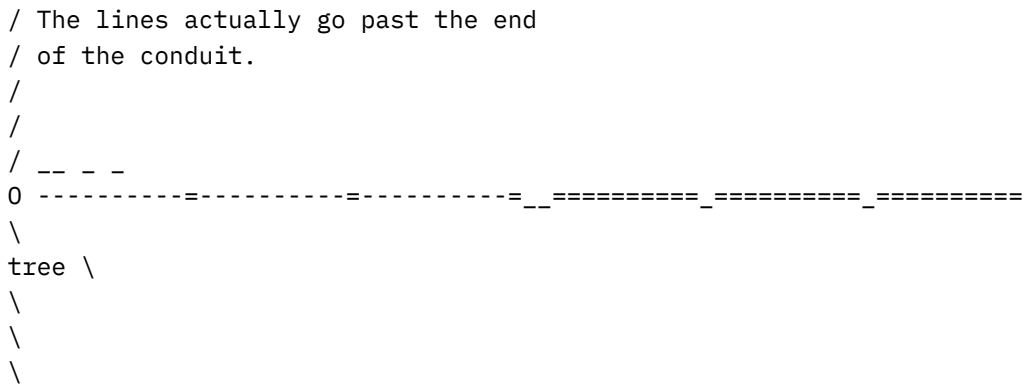
Take 3 10' sticks of 1/2 EMT conduit, 3 sticks of 3/4 EMT, and appropriate couplers. You can use pipe fittings to adapt between 1/2/ and 3/4.



Connect the three sticks of 1/2" conduit together, placing one end near the tree. (As close as you can get without interference from branches. If you can place the end past the tree a few feet that is even better.)

The stick of conduit closest to the tree should have some kind of plastic cap, or duct tape on the end to protect the parachute. At the coupler 10' from the tree tie two light ropes at least 100 feet long to the conduit coupler. You may be able to use the existing launch lanyards, if the string is strong enough to lift the conduit without breaking or showing excessive stretch. There should be less force on them than the full weight of the conduit when they are used, but this is a good test for needed strength. Lay the lines out on the ground at a 60 degree angle from the conduit, (120 degrees between the lines) facing away from the tree.

Connect three sticks of 3/4 conduit together, and attach them to the end of the 1/2 conduit, away from the tree. It should look something like this:



Now have one person stand on the end of the 3/4 conduit, away from the tree while two others start raising the 1/2 inch end. When you get the pole about 45 degrees up have two more people take up the slack on the lines, keeping them about 120 degrees apart. (each is 60 degrees from the pole. When the pole gets around 50-60 degrees up, the people on the lines should be able to control the top of the pole, and the two people who were lifting should move to help the one who was standing on the 3/4 inch end.

Now things get interesting... Team work will be very important, but lots of antenna masts have been raised this way, so it should be possible.

First everyone moves towards the tree, while holding the pole and trying to keep the top of the pole pointed at the parachute. Once you get close the goal is to stick the top end of the pole into the parachute. once this is accomplished, plant the 3/4" end on the ground, and try to lift the parachute and tracker out of the tree with the lines. If that doesn't work, try lifting up on the pole. It will be more stable if you can keep the bottom of the pole on the ground and extract the package using the lines.

Once the package is free of the tree, raise the pole near 90 degrees, and have the three people at the bottom hold it up while the line handlers run in to meet them. Then two people hold the lower end of the pole down while three others lower the pole hand over hand to the ground. Mission accomplished...

You will want to try raising the pole, and hitting a designated target high in a tree at home before going camping. I think you will find standard conduit couplers strong enough, but if you don't I suggest taking some 2-3 foot metal or wood rods and using duct tape to attach them to the conduit pole at each joint. Be sure to tape both ends, and the middle for strength.

I also like the bow method, but that will probably result in a 50 foot drop without the benefit of a filled parachute. A few bounces off the pine tree may help to slow the drop, but the landing will still be traumatic. The pole should be able to gently set the package down in

the clearing, with full control of the landing speed.

You might want to go prepared for both methods, as well as using the pole to hook a line to the package lines to apply additional force

Good luck! May the wind have blown it down to the ground when you get back there.

Rick

A while back I asked Vallivue High School if they'd like to track a flight. Here's the response. Is there an interest in doing this?

Paul

Paul,

We can do this, and we would love to, on the 19th of October. The 12th will not be possible for me, since I am splitting my time that day between two classes!

I have a two-meter antenna being delivered this week so we will be in great shape.

Does that work for you?

Ed

> does that make sense?

Now that I think about this, I think this makes the most sense.
The poles will be light weight and easy to carry. Justin's pictures
should show that the capsule is on the outside of the branches,
and not buried deeply.

> I've been looking at my 40 ft. high telescoping antenna mast

The end of the pole will be 20' of my fiberglass rod. It's stiff for it's
size and light weight.

> How about the Bow and Arrow idea? Paul and Justin, did it
> look like you could pull it out of the tree if a string were

I think so. we just need to pass the arrow bewteen the branches
and the tree trunk.

It might just fall to the next branch, but that brings it closer to us.

Perhaps my kite poles could be coupled to the PVC. The PVC
then only needs to go part way up. I also think we should have
extra poles to guide the main pole.

I'm worried that a compound bow is too strong.

Even if we just used solid pipe, the idea of having a guy rope part
way up is a good one.

Rick, I'm not fully understanding your explanation. The ropes and conduit are on the ground when we lift the conduit?

How much does conduit weigh?

Paul

If repeaters are available in an area. In this case, the only one was 146.84 and I had could only hear it on several occasions. Otherwise there were no repeaters in the area, we had to rely on simplex.

I need to learn more about how to set up a repeater, my radio will do cross-band but I have no idea what I would be doing. Maybe this winter you could give a class on it.

From: Randy Farley
Topic: 4117 Message: 4132

Yes i can make next Saturday. I could make it this Sunday if
people did not mind working that day.

Im looking into the slingshot method for simplicity. If anyone
has an HRO catalog, check out the one they sell for putting
dipoles into trees and see what you think.
You can buy the same thing at any sporting goods store.

I have done the bow thing for 30 to 40 foot trees. It is just difficult
to keep all that string from getting tangled when you are aiming
upwards. The method i use was designed for bow fishing so
the slack line always falls foreward or down if you loose taughtness
between the arrow and the line spool on the bow.
Just takes some practice and patience to get a line that high.
I am going to look into the closed face fishing spool to handle the line.
I thought about upgrading to one of those,but never had a pressing
need. This may be the pressing need now !

I'm glad you are practicing with the pole method. That is a lot of
stuff too pack into that creek even if it would work.

>>> kd7inn@... 09/09/02 10:12PM >>>
Hi all,

I have tested the tent pole method. The poles are too
flexible. I was able to put 30 feet up into the tree but I
could not direct the end of it to go where I wanted it.
I could not find Schedule 80 pipe. I looked at 1/2 inch
Schedule 40. It is much stiffer than the tent poles. I'm
still not sure that I could direct the end of it to a
specific location because of the height. When you try this
you find that 50 feet is a long way to go.
I looked at paint roller handles. They had one telescoping
handle that was 23 feet long and it was pretty steady and
light weight. Unfortunately you can't join them together to
make a longer one. Isn't there 10 foot sections that you can
screw together?
The 1/2" electrical conduit looked good but I couldn't find
a way to join them together with a dependable joint. It's
only $1.36 per 10 feet. The regular conduit couplers are to
weak for our application. Any idea's here?
Does anybody have a monkey?
Paul, do your rabbits climb trees?

Randy wrote:

I have the bow, equipment and the experience to perform this
task.
My problem is a prior commitment for this Saturday.
Does anyone in the group know how to handle a compound bow?

Randy, if we can't make it this Saturday could you make it
next Saturday?

I'm worried that a compound bow is too strong.

I would be better if i had just a recurve bow.
The compound bow does not perform real well
at partial draw,but it can be done.
You may have to sacrifice the parachute for this
method.
Also keep the spotted owls outta the way ;-)

Keep working on the poll method. Got a pack llama
arranged for all the poles?

Paul

4136. TV02F Tree Photos posted

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-10 15:29:48 UTC
From: Justin Formolo
Topic: 4136 Message: 4136

Hi All,

I've been reading through everyone's different ideas about extracting the capsule from out of the tree. I don't think some of you know what we are up against so I posted a few photos on the Yahoo group page. I was going to wait for them to be posted at our website, but things are moving along at an increasing speed . They are in the photo folder called TV02F Capsule. I have decided to name the tree, well "The Tree." I know, real original. I have called it other names which can be spelled out by holding the the shift key and typing the number keys randomly on a keyboard. I'm not sure if the photos can get any larger than they appear on the group page, they looked small to me. Hope they can shine some light on a practical idea to get this thing out.

Justin, KD7PIT

4137. Pushups

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-10 15:36:57 UTC
From: Doug Rich
Topic: 4137 Message: 4137

I have worked with a commercial 40' pushup. I is made with airplane aluminum and is very light weight. It has guy rings and if any type of pushup would work this would be it. BUT. At full length it is not usable without guys. It even has a device you put your truck tire on to help hold it in place. I don't think anything less would work and this only goes 40'. I suggest you try some other method.

4139. Re: TV02F Tree Photos posted

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-10 16:06:25 UTC
From: Justin Formolo
Topic: 4136 Message: 4139

REVISED:

I just found out how I can get the photo's to acual scale. Instead of posting them to the "Photos" file, I placed the pictures in the "Files" section of the Yahoo group page. It's in a file called "TV02F Capsule and Tree" Sorry for the sudden change but it's a great improvement.

Justin, KD7PIT

4140. Re: [tvnsp] TV02F Tree Photos posted

Yahoo group: tvnsp (2000 — 2002)

From: John Knapp
Topic: 4136 Message: 4140

Thanks Justin for posting the pictures. After looking
at the tree and reading some of the comments about
using poles, etc both Deb and I believe the best way
to retrieve our lost package would be to climb the
tree and then use a pole to either push the capsule
out so it will drop to the ground or to pull the
capsule in to the climber.

Hope to see you Thursday night at the Jade Garden.

John and Deb

John, do you want to schedule a meeting that focuses on getting everyone's HTs programmed for likely repeaters? Perhaps we can get a map of repeater coverage to go with every chase vehicle.

4145. Odds and Ends

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-10 19:59:12 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 1077 Message: 4145

Last night I wrote the 300th page of the near space book, The Near Space Files. I am planning to send a couple of chapters to Parallax next week so they can begin the final edits.

Currently I'm writing one of its appendices. This appendix covers the BS2p lessons that I will teach to TVNSP this Fall/Winter.

Sky and Telescope would like more photograph submissions from the balloon program. I'd like to send them photos of sunrise. Can we schedule another launch before the end of the year to record sunrise?

It was funny, Ms. Joson, their photo editor, asked me if I was an astronaut. She also asked (twice!) that we were really amateurs, and not professionals. She is very impressed with our webpage and the photograph.

We need to bring the unused helium tank back to Sheehans. I'll pay for the used tank today after school. We have a 1500 gram balloon and three partial tanks of helium to use this year.

Don't forget, Vallivue would like to be get involved with tracking a flight.

Paul

4146. TV02F Data

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-10 21:08:28 UTC
From: verhap@occ1.sd01.k12.id.us

I'm including a clean TV02F log and a Quattro Pro spread sheet.

I'll have several graphs for TVNSP crew at our next meeting.

Enjoy.

Paul

PS, does anyone know if the Snake River club will be meeting at Elmer's next week?

PPS, who plans to be at the VOI meeting this week?

PPPS, Doug, is their a microcontroller meeting before the VOI meeting? I'm putting together a set of lesson plans for the BS2p that TVNSP can arrange to teach.

Paul (and everyone else),

The VOI is kicking off an EMMETT chapter with a meeting this Thursday at
7 PM at the Pizza Factory in Emmett. All are invited to attend. Talk in will
be on 146.52

Tim....

This winter if Bill would do a class on something of
this nature, it would be a great idea. I am not sure
at the current time when the next regularily schedule
meeting is but we need to have everyone present so we
can work up a training schedule, etc.

> There has been an article(s) in QST about a way to put an antenna
in
a tree. You float a line over it with balloons, drop the line, hook
the capsule/shroudlines/parachute? This might allow you to get at it
from the top if that would help any? Much like you do with the
lanyard
launch but smaller scale.
>
> What they used in QST was party type balloons, so maybe one of
those
party balloon kit tanks? Anyway, just a thought, I'm sure you will
know instantanlty if it has any use. If not sorry for the wasted time.

> Don

I haven't been able to find the magazine or article. It has a good
drawing or photo of the way to do it. I uploaded my very simple
drawing (balloon_recovery.png in files) as a means of illustrating the
idea.

From what I can see in the photos it looks like this should work. It
might be a lot simpler and saver than all the saws and long
booms/masts etc.

FWIW, since I posted this with a subject relating to a digest, I'm
not sure if anyone even saw my first post.

I would think with 3 people you should be able to do pretty well at
pulling it down.

Don

Hi John,

During my vacation I asked Stephanie to take care of it on a
temporary basis. I'm hoping you will take over on a longer
term basis unless Stephanie request's to do it. You might
ask her directly.

Mark,

The interval was 19 seconds.

Hi John,

The regularily scheduled meeting would be Sept. 20th.

From: Mark Conner
Topic: 4158 Message: 4158
Attachments: 1 described; binary payloads are missing from this source WARC

Here's a graph of the ascent/descent rates and wind speeds for the flight. I tried to fix the obvious missing data by dividing the rate by the apparent number of missing observations - no correction done to the corresponding altitude. I don't think it makes too much difference for seeing trends.

The top 10,000 ft or so probably average ~2000 ft/min, which would be a record by a long shot. Justin's log has his own GPRMC time hacks every 10 seconds interspersed with the received data. Ralph, would this be good enough for record determination if the least favorable time assumptions were used?

put a wood dowel inside each section. a 3 foot section should make
enough splices to get to 50 feet.
mike wb7rws
Hi all,

I have tested the tent pole method. The poles are too
flexible. I was able to put 30 feet up into the tree but I
could not direct the end of it to go where I wanted it.
I could not find Schedule 80 pipe. I looked at 1/2 inch
Schedule 40. It is much stiffer than the tent poles. I'm
still not sure that I could direct the end of it to a
specific location because of the height. When you try this
you find that 50 feet is a long way to go.
I looked at paint roller handles. They had one telescoping
handle that was 23 feet long and it was pretty steady and
light weight. Unfortunately you can't join them together to
make a longer one. Isn't there 10 foot sections that you can
screw together?
The 1/2" electrical conduit looked good but I couldn't find
a way to join them together with a dependable joint. It's
only $1.36 per 10 feet. The regular conduit couplers are to
weak for our application. Any idea's here?
Does anybody have a monkey?
Paul, do your rabbits climb trees?

4160. Re: [tvnsp] TV02F Tree Photos posted

From: Jeff Melanson
Topic: 4136 Message: 4160

Hi all,

John and I are on the same track. A hunter I know will let
me borrow his tree climbing equipment. It starts with a
light weight 13 foot ladder that straps to "The Tree". Next
there are 17 foot of strap on steps. These steps have straps
that wrap around the tree to hold the steps in place. Then
there is the safety belt for the climber that also goes
around the tree. The ladder and steps puts someone 30 foot
up "The Tree". There are plenty of branches to use as steps
to go a little higher. Next someone would use a short pole
to snag the parachute/payload. The 15 ft collapsable tent
pole I have should do the trick.
I think we need to be prepared to use different methods.
Randy said he would be available with his bow on Sunday.
Would that day work for this rescue attempt?

Be cautious using maps showing repeater coverages. They will tend to show ideal coverage, not realistic coverage. Also, subtle changes in terrain not covered by the maps will fool the coverage map into showing better coverage than you'd think, or would provide radio holes in areas where you'd otherwise have good coverage. I can think of a couple Treasure Valley sites where this is the case (2m rf holes), but a map showing coverage of Cinnabar would indicate good coverage.

4164. The Road

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-11 00:57:08 UTC
From: Jeff Melanson
Topic: 4164 Message: 4164

Hi John the Elder (Therefore the wiser theoretically),

Paul tells me that you traveled to Pine on a dirt road but that the Ambulance came back on a paved road. Isn't the main road to Pine paved? What's the story on the roads? Is Anderson Dam the paved road? Anderson Dam road becomes Lake Creek Rd on my map. Then it becomes Sloan Gulch Rd. Then when you pass Pine it becomes FH61. Is there another road not on my map?

I am glad you put theoretically. We went in through
Dixie. That road is dirt most of the way to Pine. I
follows the west side of the Dam. The main road
follows part of the dam but cuts south from the dam to
Highway 20. Nice road.

Both should be on the map, I don't have mine handy,
will bring it with me Thursday night.

From: Ralph Wallio, W0RPK
Topic: 4158 Message: 4167

Let me get this straight to make sure I haven't been paying attention. The payload periodically reported altitude but without time stamps. Justin's ground station captured these reports while also capturing $GPRMC frames. Mark used time stamps in these local $GPRMC frames to position payload altitudes in time, with accuracy limited by payload report and $GPRMC intervals and by missed payload packets.

Assuming this is close to correct, I think it is reasonable to use these pseudo time stamps to calculate ascent rate and, when using least favorable error margins, for an ascent rate record submission. The value would be over any 10,000ft (or more) of ascent.

Standing by.

Two cross-band repeating radios will act as one repeater, ie. VHF->UHF on one cross-bander, UHF->VHF on the other (same UHF and VHF frequencies on both radios, of course). The main thing to remember when doing this though, is to be sure and pause long enough for the cross-banders to switch between xmit and receive.

Oops,
the spread sheet has them already. They were one minute
intervals nominally. Towards the end several packets were
dropped. From the graphs, I was able to detrermine where packets
were dropped and how many. I accomplished this by trying to
smooth the data. I'll see if I can get my Quattro Pro spread sheet
into a comma delimited file.

4175. (Fwd) Tree Saw

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-11 14:53:17 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4175 Message: 4175

Russ has suggested we carry a tree saw to cut lines (not limbs) if necessary. Here's the dimensions of his saw. The handle of this saw could be used to push the capsule free.

Paul

Hi Paul

Here are some pictures of my extendable tree saw. Open from top left to right, next row, left to right.

Collapsed: 6'

Extended 11.5'

Saw length 1.5'

Weight: 4.6 lbs

Shaft: Fiberglass

Blade: Removable

Other: Roper Operated Scissor

Hope this gives you an idea. I'm thinking climb 30' up the tree ladder, hoist the saw up by rope, flip the sucker out of the tree with the saw. Maybe use the scissors to cut the parachute ropes. Use the hook to grab and yank the thing down. No limb cutting.
No pipes to glue,
no guys to fix,
just yank down
the son-of-a-%$*)@ !!!

Don's idea is to use a cord with several party balloons filled with helium. The balloons are tied to the center of the cord, while two people hold the ends of the cord. This creates an arc of cord that can pass over the top of the tree. We then walk the arc over the tree or up against the capsule and try to snag it.

Paul

From Don Pfister.....

That's why I said one of those little party balloon kits (like at paper warehouse or something) I think they cost like $20. It only has about 10 or 15 cu ft. and balloons. I think that is what was used in the article. Perhaps put it on a backpack board or something?

4179. Male and Female DB-9 Connectors

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-11 15:19:27 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4179 Message: 4179

When should either a male or female DB-9 connector be used on a serial connection? I know serial devices can be classified as either DCE or DTE, and I believe that determines whether you use the male or female version.

How does someone decide that a GPS reciever should be DCE or DTE?

I want to standardize the GPS connectors to my flight computers, and I want to do this the smart way (in a way that I assume is already the standard).

I don't have an Etrex to look at, but I believe it's connector is a female DB-9. Is this a standard for other GPS recievers?

Paul

4180. Re: [tvnsp] Male and Female DB-9 Connectors

From: Ralph Wallio, W0RPK
Topic: 4179 Message: 4180

The standard for DCE (Data Communications Equipment), e.g., modems, muxes, TNCs, is female. The standard for PC serial ports is male. The standard for all other stuff, DTE (Data Terminal Equipment) or otherwise, is AC/DC or how you are feeling at the moment of decision. -w0rpk

> already the standard).

I started with a DeLorme Tripmate for my setup, and it had a molded female DB-9 designed to plug into a laptop. I've basically stuck with that since. I've also done the "power on pin 9" where needed, taking care not to wire that where a laptop or other computer equipment might be connected.

This facilitates computer programming of my Garmin GPS-35 for things like which NMEA sentences to spit out, what rate, etc.

I don't see much of a reason to wire a GPS the other way, except possibly as a dedicated hookup to a KPC-3+.

4182. Spammage on Yahoo lists

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-11 14:46:55 UTC
From: n9xtn@cox.net
Topic: 4182 Message: 4182

I think someone has created a bot or script or whatever that will create a Yahoo ID, subscribe to a whole bunch of groups, then spam them all. It must take some time to execute because there's a several-hour delay from when I get notified of a new subscriber to when the spam is attempted.

There's a couple of ways to mitigate this on Yahoo:

1) Turn on notification of new subscribers. If they have a weird ID like what's been used to spam the lists, delete or ban them immediately. I've had 3 attempts on KNSP and have deleted them before they got to the "send the spam" part of their script. This puts the work on the moderator to get the notification and be able to delete them within a few hours.

2) Turn on approval of new subscribers. All new subscription requests require moderator approval before posting. This can be a pain for the subscribers, but might be worth it.

> male or female version.

Well, sort of. IBM screwed up the RS232 spec with the original PC and it's been a mess ever since. (For those not familiar with it "true" RS232 devices all have female connectors and cables have male connectors. IBM didn't do it that way.)

The sex of the connectors is not directly related to whether a device is DCE or DTE. DCE (Data Communications Equipment) is things like MODEMs or TNCs. DTE is things like computers, terminals and printers. However, we often wire things based on what we want to plug them into rather than what they really are.

> How does someone decide that a GPS reciever should be DCE or
> DTE?

In this case you probably want to wire them as DCE since commercial cables are going to be wired that way so that you can plug them directly into PCs. You can then wire flight computers and the like to be DTE and plug the GPS units into either.

> female DB-9. Is this a standard for other GPS recievers?

Yep, they assume that you want to plug the GPS into your PC.

From: Randy Farley
Topic: 4136 Message: 4185

It would be nice if your hunter friend could do the climbing since
he is experienced. If anyone climbs, a safety strap must be mandatory
for safety if you choose that method of retrieval.

I think archery season for deer and elk is still open. He could hunt after everyone left.
Probably not a good idea on second thought,all the noisy balloonies would probably scare
the game away for weeks ;)

Has anyone figured out a quicker or safer route to the site such as following a ridge line
on either side of the creek?

Usually the easier game trails are on top of ridge lines.
From what Justin described to me last night,the
game trails he and Paul used were rather sparse and dead ended quite frequently. Remember
even animals take the path of least resistance to their destination. Maybe the local forest
ranger could give some advice.
He would probably like to get the "debris" out of his forest ;)

Just some rambling thoughts while taking a break.

regards

Randy Farley

>>> kd7inn@... 09/10/02 05:40PM >>>
Hi all,

John and I are on the same track. A hunter I know will let
me borrow his tree climbing equipment. It starts with a
light weight 13 foot ladder that straps to "The Tree". Next
there are 17 foot of strap on steps. These steps have straps
that wrap around the tree to hold the steps in place. Then
there is the safety belt for the climber that also goes
around the tree. The ladder and steps puts someone 30 foot
up "The Tree". There are plenty of branches to use as steps
to go a little higher. Next someone would use a short pole
to snag the parachute/payload. The 15 ft collapsable tent
pole I have should do the trick.
I think we need to be prepared to use different methods.
Randy said he would be available with his bow on Sunday.
Would that day work for this rescue attempt?

4186. Antenna pickup (Justin)

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-11 17:35:02 UTC
From: BLOHM,BILL (HP-Boise,ex1)
Topic: 4186 Message: 4186

Justin,

Feel free to e-mail me offline at bill_blohm@... to set up to pick up the antenna, mast, base, and cable. I would like to take it with me next week, and if you're over by MicronPC, I go by that area on the way home anyway, so it wouldn't be a bother to swing by after work, or on Saturday if that works better.

If you'd already posted something on this, I must not have got all the TVNSP postings or just missed it in the flood of postings.

Dr. Atkinson of U of I in Moscow has scheduled TVNSP in for a colloquium for 3 April 2003, a Thursday. We'll discuss aspects of getting a near space program started. I'll try to get professional leave to present that day. I'd like some of the TVNSP crew attend, if possible. They'd also like to see a launch. If winds won't cooperate, I think we'll just launch a dummy capsule with a simple radio beacon.

Does anyone think they can make it? Randy, I think it will be alright for you to wear your bell-bottoms, if that will help.

They love last Novermber's video and have made copies of it.

We may get some questions from the Alabama Space Grant about amateur near space programs.

TVNSP is making an impact on the world, and not just where our capsules recover without parachutes!

Cool
This should be plenty of notice for me. Calender has been marked and highligted.
Cannot find the bell-bottoms,so i won't embarrass you Paul.
Hmmm...m i now remember where the tie-dye shirt is though ;)

>>> verhap@... 09/11/02 12:54PM >>>
Dr. Atkinson of U of I in Moscow has scheduled TVNSP in for a
colloquium for 3 April 2003, a Thursday. We'll discuss aspects of
getting a near space program started. I'll try to get professional
leave to present that day. I'd like some of the TVNSP crew attend,
if possible. They'd also like to see a launch. If winds won't
cooperate, I think we'll just launch a dummy capsule with a simple
radio beacon.

Does anyone think they can make it? Randy, I think it will be
alright for you to wear your bell-bottoms, if that will help.

They love last Novermber's video and have made copies of it.

We may get some questions from the Alabama Space Grant about
amateur near space programs.

TVNSP is making an impact on the world, and not just where our
capsules recover without parachutes!

Paul

What is the free lift of these balloons? Can it Lift a 2.3
pound capsule? Can it pull a snagged parachute out of the
limbs? Can you pull in a different direction than straight
up?

He won't be able to come along. He loaned me the equipment
which includes a saftey strap for going around the tree plus
I borrowed a couple of safety lanyards from work. I'll bring
the equipment for Thursday's meeting so we can look at it
and other options.

Yes, I looked at some Topo Maps with my brother-in-law and
there is a much easier way into the area. It was the Delorme
Topo Maps for a computer. Unfortanatley I can't run it on my
laptop. It needs 300 MB to run and my small hard drive
doesn't have enough room. If you would like me to bring it
to the meeting to load on your laptop it would be really
helpfull. It gives you 3D profiles to show you the how much
climbing and descending you have to do. It makes it easy to
pick a route. In addition there is a sporting goods store
called the benchmark that has a computer that generates full
size waterproof Topo Maps for $8.00. I plan to pick one up
and bring it to the meeting.

Can we have a quick tally of those coming to the meeting? I
will be there and I know Paul and John Knapp will be there.
The more heads we put together the better. Even if you can't
come on the retreival trip you should still come to the
meeting if possible. John scheduled us for 6:30 pm at Jade
Garden.

John the elder (and therefore should be wiser),

I'm a little confused. Do you have the tanks? If your
looking for someone to take the full tank back to Sheehans I
can do that. You can bring the tank to Thursday's meeting
and we'll transfer it to my truck. I can take it to Sheehans
on my lunch hour on Friday or if we do the capsule retreival
trip on Sunday then we can probably take the tank back on
Saturday.

Subject: Re: QST 2/1999 page 54

Can I put it on the yahoo groups files section or would that be considered a web
site? IT shouldn't show up on a web search. (I think) you have to me a member
of the group to access the files section. How would you view that?

Here is the group file section if you would like to see what I'm referring to? I don't
think you should be able to access it without joining but I'm not completely sure
how it is set up.

I would do all I can to be sure the copyright is honored and known. Possibly put
a copyright line on it?

Thank you!
Don

One of the email groups on High Altitude Ballooning (you have
printed some of
their articles), has a capsule stuck in a tree.

I thought the article "The W7DE Balloon Erection Scheme" could
be modified for
them to safely recover their capsule. I would like to send this
article to them
so they can review it. I saw it listed on the ARRL web site but
not the article.
I'm concerned about the safety of some of the methods they are
proposing.

May I please have permission to scan this article and send it
to the group? They
are thousands of miles away and the web seems to be the
fastest, easiest way to
get the info to them.

Thank you for your consideration,
Don

While the article as you can see, thanks to the ARRL, it to put an antenna into a tree. I think you could modify it to server your purpose. I bought a 3' balloon for $2 (not in the flower area, but at the checkout). I would think even mylar balloons would work. Keep adding balloons until you get the lift you need. ;-)

Anyway, it is a suggestion not a worked out solution. ;-) I was even thinking if you used another line across the line with balloons you could drop a hook (maybe one of the 3 prong hooks <dulled perhaps>) to grab the parachute or shroud lines or capsule. Maybe even dropping the line over a higher limb to give you more pull? I can't tell much detail from the photos, they were pretty dark to my eyes.

Maybe some kind of monofiliment or something would be strong but light to lift up there. To me they are suggesting in the article to use one of those party balloon kits (I think it has like 9 cu ft of helium tank). You might be able to hook it to a backpack board to carry in to the tree.

I am just trying to help. ;-) Sorry I'm not there to really help - physcally that is. ;-)

Sorry this took so long, it got covered up by other windows and not noticed till now...

verhap@... wrote:

> How much does conduit weigh?

EMT is standard thin wall electrical conduit.

I don't have numbers, but the weight of a stick of EMT is equal to or slightly less than Schedule _40_ PVC pipe and the conduit is much stiffer. Schedule 80 pipe would be stiffer but also about double the weight. I think you will find EMT the lightest and stiffest common construction material available. I suggest you hit a hardware store and check out weight and stiffness of materials before you commit to one.

Your fiberglass rod might make a good top section. If you use fiberglass for the top 10-20', you still probably want some 1/2 conduit for light weight near the top and 3/4 for additional strength at the bottom.

The extending antenna mast + fiberglass pole might be a good choice too, but that is ten foot sections, and must either be extended while on the ground, or you need to be several feet off the ground to comfortably extend the sections.

> I'm not fully understanding your explanation. The ropes and
> conduit are on the ground when we lift the conduit?

Yes, if you have space in the clearing, laying it all out flat on the ground, then lifting it into place in one piece will probably be the easiest way to get it into the tree.

Pretend the ropes are guy wires and you are putting up a tall antenna. The tricky part is hitting the parachute with the top of the pole on the way up. You can do this with only two guy wires because the pole will always be leaning on them, at least until you have the package out of the tree, and you are ready to let it fall back into the clearing.

However, after looking at the pictures, vertical assembly near the tree might be better. For this I would suggest you pre-cut the conduit into five foot lengths, and pre-attach a coupler on each length. Use a tubing cutter to make sure you get square ends on the cuts. I've found that if you have square ends, firmly pressed into the standard couplers, then tighten the screws on the coupler until the head touches the threaded part of the coupler there is more flex in the tubing than the coupler. I suspect under tension you will pull the conduit out of the coupler first, but under compression or flex the conduit will collapse

somewhere other than in the coupler.

Anyway for vertical assembly, you stand right under the package, next to the tree. Three to five feet away is probably good. Hopefully you will be able to see the tracker package and/or the parachute from where you are standing.

Lean your fiberglass pole (or what ever top section you chose) against the tree. It should have two lines, at least as heavy as load lines, probably more like parachute cord or 1/4" nylon rope tied _and_ taped about five feet from the top end. The ropes should each be 70-100 feet long. both for leverage, and to make sure the line handlers can not be hit by the falling pole. Lift the pole up a little, and duct tape it to the top section of conduit in _at least_ three places. (The top of the conduit, the bottom of the pole and the middle.) The longer the distance between the top and bottom tapes the better. You may want the bottom of the fiberglass pole right at the coupler at the bottom of the conduit.

Raise the pole up enough to slip the next five foot section of conduit into the bottom of the pole, and tighten the lock screw until the head touches the coupler. About half way up switch from 1/2 to 3/4 inch conduit. If the top of the pole has fallen into the tree, pull the pole away from the tree, then gently rest it against the tree so it stays near the outside of the tree. You want it resting against the tree so you can use the tree to guide it towards the package, not stuck inside where the tree takes control of the point of the pole.

Repeat the last paragraph until the top of the pole is within 5 feet (one section) of the package. On this lift you must do what ever it takes using the ropes and the pole to get the pole either inside the parachute (preferred) or between some of the parachute lines. Attach another section at the bottom. If the top sticks out less than two feet above the parachute, attach _another_ section of conduit to be sure the lines won't slip off.

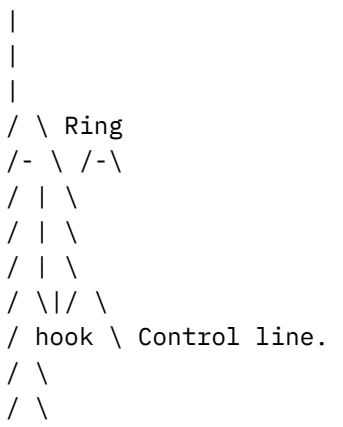
Now have the line handlers move away from the tree, and _fully_ extend their lines. If possible, they should be 120 degrees apart. Now between shaking the pole, lifting the pole and pulling on the lines attempt to pull the package out of the tree. Go slow, and don't pull too hard, or you may break parachute lines. I expect a combination of lifting up on the parachute, pulling out lightly with the lines and shaking the pole will free the payload, and it will fall with the top of the pole. If only one line handler can be in the clearing, they need to run directly away from the tree once the package is free to make it fall into the clearing. Once the fall direction has been established, probably about 5 to 10 feet, let go of the rope, and make sure you don't get hit by any falling objects.

Once the line handler has caused the package to fall towards the clearing and dropped their rope, it might be good for the person at the bottom of the pole to throw it as hard as possible away from the

package, so it can't fall on the electronics. The best time for the throw maneuver is between 45 and 30 degrees up from the ground. Just pick up the bottom end to about shoulder level and throw it away from the package. I don't think there will be enough mass in the pole to damage anything through the foam in the cooler, but better safe than sorry.

The balloon idea has definite possibilities too. What is the smallest He container you can find? An aerosol can sized one would do a few balloons and be easy to carry. I would suggest you send up the following stack:

balloon(s)



Send up the balloon(s) with a hook and sinker hanging down from the ring. Use double load line, or heavier cord from the ring to the hook. The control line should be fishing line for light weight. Use two lines and three people so your balloon launch training can be used to attempt to hook the parachute lines of the target package. Once you have them firmly hooked pull the fishing line out, and pull a much heavier recovery line through the ring using the fishing line. (I suggest you tie and tape the recovery line to the fishing lines before you start. You may need to go back to the fishing line and try again if the hook pulls out.

My thought is that the fishing line is not strong enough to pull the parachute and package out of the tree, and the party balloon(s) are not strong enough to lift the recovery line. Once you get the hook in the parachute lines, you pull the heavy cord through the ring then pull on both ends of the heavy cord to dislodge the parachute and package.

Try to keep the balloons out of the tree so if the hook comes undone you can just pull the heavy cord out, pulling the fishing line back in and try again.

If a reasonable number of party balloons can lift a cord strong enough to yank the parachute and package out of the tree you may not need to use the fishing line. The only way to know is to measure the lift of a party balloon, and the weight of 100-120' of line.

I suggest you prepare for at least two methods of rescue before you start hiking. If you think balloons are feasible, I'd suggest you try them in this order:

balloons, poles, climb the tree.

I consider climbing the tree to be the most dangerous of the methods, and the last thing to try. I like the idea of having both my feet on the ground.

Also consider extra balloons and He to allow you to place your repeater antennas as high as possible.

Good luck. Wish I could be there, but I've got to be at the monthly Magic Valley Astronomical Society meeting Saturday. (Sometimes it sucks being an officer. :( )

Rick

Jeff

I have the same problem. I bought the top 2.0 program and it is too big
and buggy to run on my laptop. I should have returned it,but thought i
would have a bigger machine by now.

I cannot make thursdays meeting. I have to fill in for our club president
at our TVRA meeting tonight since i am the vice president :(

If Justin makes it,he has a wrist rokcet slingshot he can demo that i loaned him from one
of my friends. He can report his testing to see
if it is a viable alternative retrieval device.

If you can find any type of ATV trail, you are welcome to use my
4-wheeler if you decide to go Saturday.

Yes, I looked at some Topo Maps with my brother-in-law and
there is a much easier way into the area. It was the Delorme
Topo Maps for a computer. Unfortanatley I can't run it on my
laptop. It needs 300 MB to run and my small hard drive
doesn't have enough room. If you would like me to bring it
to the meeting to load on your laptop it would be really
helpfull. It gives you 3D profiles to show you the how much
climbing and descending you have to do. It makes it easy to
pick a route. In addition there is a sporting goods store
called the benchmark that has a computer that generates full
size waterproof Topo Maps for $8.00. I plan to pick one up
and bring it to the meeting.

Can we have a quick tally of those coming to the meeting? I
will be there and I know Paul and John Knapp will be there.
The more heads we put together the better. Even if you can't
come on the retreival trip you should still come to the
meeting if possible. John scheduled us for 6:30 pm at Jade
Garden.

I hope this works for Mark, i could not find the SA map of the flight on the laptop lastnight. Do you have a copy of your track from Street Atlas?

>>> J_Formolo@... 09/11/02 09:36PM >>>
Mark,

I have the track my eTrex recorded on the SA map loaded in the files section on the Yahoo group page.

I'm beginning the planning for TV02G. That will be the Vallivue launch. We'll need to plan what to teach the students and how. I'd like to discuss this at the next, regularly, scheduled meeting.

I'd like to launch one of my capsules and Jeff's tracker on this flight. We'll use the 1500 balloon and our remaining helium. We should make 90,000+ feet on that flight.

I may try to modify a small digital camera by then. My hope is to have a small, light-weight camera suitable for tracker capsules like Jeff's.

I think this would be a good tool to carry in our mountain
packs. Light weight and portable. I know you could
drag the chute and capsule off the limb with this.

http://www.ezhang.com/

Another option would be this Item:
Probabley the most accurate of the two and better built.
I'm seriously considering this one for bowfishing.

We are having a meeting to plan for the retrevial of
the 'hung' capsule. IT is at the Jade Garden at 6:30.
When we set this up we did not know about the Emmett
Chapter meeting. That information came out after we
were scheduled.

Hey John,

I have my bowling night tonight at 6:30pm in Garden City so I will not be at Jade Garden tonight. When do you think you can drop off the helium tanks? I should be home most of the day, but I have to drop off my truck at the body shop, hopefully within the next couple hours this morning. Just give me a call, I should be around!

846-9219

I am not in any hurry to get my antenna back, so don't worry too much about it.
Please check out my new website at www.tvnsp.org !

Let's go ahead and meet tonight, at least we can discuss options and go from there. I was a little concerned that Randy and Mike couldn't be there tonight, their imput is usually very good.

Who else can be there? We need as many minds as possible to discuss the recovery. Justin, can you make it? If so, please bring your pictures with you. I will bring a projector so we can have a better look at them.

Ya, I can be there tonight at Jade Garden. I'll transfer the pictures onto a diskette or maybe a CD-RW disc. I might not be able to help out Sunday because I'm meeting with a study group to prepare for our first BIG test of the semester on Monday morning. That is really important to me right now and is priority #1.

Justin.

4222. MIM Docs

I'm looking for MIM documentation. So far I have nothing over the net. What I have at home is the 1.04 version of the documents. My MIM isn't sending clear packets and the HT is notr constantly keyed during CW ID. I need to find out about the J1 jumper, which I believe is used to put the MIM into HT mode. I also need to find out if the MIM already has a cap in the audio line and a resistor in the PTT line (I've added those to my PCB design and that may be messing up the packets).

So if anyone knows where MIM documents can be found online, please let me know. So far a search on MIM and micro interface module have turned up dead ends.

Paul

4225. Insurance company for VOI

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-13 00:03:31 UTC
From: Mark Conner
Topic: 4225 Message: 4225

Can anyone tell me what company VOI uses for their liability insurance? I'm trying to work something with our local radio club regarding insurance. I did a search of the archives for the name and came up empty.

- Mark

4226. Regular meeting

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-13 04:03:12 UTC
From: John Knapp
Topic: 4222 Message: 4226

The next regular meeting of TVNSP will be at the Jade Garden in Nampa at 6:30pm. Date is Sept. 20.

Randy, can you do your APRS presentation? If not, we will do Liftwin and, possibly, Balloon Track.

4235. Capsule Rescue, part 2

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-13 22:50:02 UTC
From: John Knapp
Topic: 4228 Message: 4235

Paul, Jeff, and Randy

I just talke to KG7CN, Dave, in Mt. Home. They are headed up to Pine in the morning. He was using his mobile radio in his truck last week, has bought a new Yasuea radio and will be installing it in the cabin. I told him you would contact him on Simplex when you get up there. He is very interested in the group and has joined the list. He will probably see this email :-)

Other important information, courtesy of Dave. The road you want is at milepost 127. There is a sign that says Featherville and Pine. It is 19 miles to Pine, all paved.

The weather is changing, the freezing level will be dropping to 7500ft Saturday night, could be a little cool up there Sunday morning.

The road, FS183, is also called Wagontown Road. The turn off may a little difficult to find. He said that the road is good, but there may be a lot of ATV's on it. Be careful of those little guys.

Good luck and good hunting

Jeff, Paul

I picked up three VGA 15in Monitors, one 14 in. Monochrome monitor, and two printers.

There is a gentleman interested in one of the P133's we picked up earlier so we need to put a price on them. Lets discuss this Friday at the meeting, not on the list.

What do you estimate the walking distance to be Jeff?
Is the terrain easier than what Paul and Justin encountered.
Will a small backpack suffice along with my bow?
Dont like to carry any more weight than necessary
Just anticipating what an age enhanced guy should bring
to keep up with the 'youngins"s ;)

And where i can i meet you guys along the freeway?
I assume you will be on 147.240 also.

Randy,

When Paul and Justin went in they travelled 2.2 miles over rough terrain. We will travel 3 to 4 miles on a trail then 1 mile off the trail. It doesn't look like it will be anything like what they encountered. It should be much easier.

Paul and I will be leaving my house at about 6 am and should be on the freeway shortly in ten to 15 minutes. Plan on being in our area at about that time and we'll meet on 147.24.

Paul and I checked the weather for the mountains and it will be 70 to 93 and partly cloudy. Sunday night will be thunderstorms and rain.

I don't plan on walking to fast, it uses up to much energy. Paul naturally walks faster with his long legs. He'll have to slow down for us.

4250. Quick flight summary

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-15 18:22:43 UTC
From: Mark Conner
Topic: 4250 Message: 4250

Everything went pretty well today. The launch was only a few minutes late at about 8:04am. A few minutes before 8, we saw a hot-air balloon flying by within about a half-mile and about 2000 ft AGL. Not sure if he saw us or not. In the payload videotape, you can see the balloon on several turns of the camera, but it's hard to see it against the ground a few minutes later. As stated earlier, the tape stopped before landing.

Primary, backup, and simplex repeater functioned throughout the flight. The simplex repeater only had a few contacts, the most distant one being a station near Des Moines. We also noticed poorer signal strength as well, though I don't think it was enough to account for fewer contacts. Maybe we just didn't have as many try. I may have to put a 70cm twinlead J-pole with a short coax feed on and just let it hang. Surely that won't be long enough to short power lines.

With perfectly clear skies today and a good position relative to the sun, we were able to see the balloon with the naked eye. A few saw the balloon burst with binoculars and were able to see the package fall away from the shards and the cloud of talc. I could see the talc for about 15 seconds after burst with unaided vision.

We noticed the spiraling descent again caused by the balloon remnants deforming the chute. The 350g balloon shredded cleanly and not much came back.

The package landed in a cornfield about 0.3 miles off the road. We were able to walk on a grass trail and beans for most of it, but then had to hike into the corn about 200 yds to retrieve it. The GPS led us right to it, and we had observers on a rise above the field to help direct us too. The chute was lying on the tops of the corn but the payloads were resting on the ground.

Hi John,

What frequency did you speak to them on and what is the lat/lon of the capsule. Sorry to hear about Deb.

The working frequency is simplex - 146.52. The
repeater frequency is 147.84, PLL tone 100, minus
offset.

The capsule is at approximately 43.3262N and
115.2074W. This is the last reported location on
findu. The balloon did drift a little from that
location thought. Sorry I can't be more accurate.

A lot of my information is coming directly from KG7CN
by telephone. He has a beam pointed directly on them
on simplex. I am monitoring the 84 repeater, I have
talked to Randy on that frequency.

4255. Measuring acceleration of payload at launch/burst

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-16 02:30:37 UTC
From: Mark Conner
Topic: 4255 Message: 4255
Attachments: 2 described; binary payloads are missing from this source WARC

I've always wondered how long it takes for a balloon to reach a steady-state ascent rate after launch. It's pretty hard to eyeball from the ground.

On my payload, I use the $PGRMV sentence to determine vertical velocity. This is handy for determining launch, burst, and vertical velocity while in flight. The output of the sentence is in meters/sec, which I convert into feet/min.

The attached graphic shows the data right after release of this morning's NSTAR 02-E flight. The beacon rate is set to about an 8-second interval after launch, then it's 30 seconds after a couple of minutes. The magenta points are computed by subtracting altitudes for consecutive reports, the blue points are those from the $PGRMV.

The first packet sent as a result of vertical motion being detected is at 13:04:17. At that time, both reports show an ascent rate of about 300 ft/min. This is at an altitude of about 150' AGL. After that, the two curves diverge for about a minute. The $PGRMV shows a steady increase to 1250 ft/min over about 45 seconds. Finite differencing shows that by 10-12 seconds after launch, the steady-state rate is already achieved.

I think that at least the vertical (Z-axis) component of the $PGRMV data has some filtering done to the velocities. A similar effect can be seen right after burst. The finite difference method jumps quickly to a large descent rate (negative value), while the $PGRMV-derived rates are slower to change.

Other than the differences after sudden changes in vertical velocity, the finite differencing velocities would match quite well with the PGRMV sentences.

John,

The tree grew 50 feet during the week. The capsule is at
least 100 ft up. The tree towered over us holding the
capsule as if to say "Ha Ha, you can't reach it!". I have no
plans to go back.

Many thanks to Dave KG7CN and his girlfriend for monitoring
our progress and for having dinner waiting for us when we
got back. It was nice to know someone knew where we were and
the meal helped us regain our strength.

From: verhap@occ1.sd01.k12.id.us
Topic: 4260 Message: 4260

Dave, the envelope I'm sending has a 8 X 10 photograph taken from 86,000 feet. The horizon is 390 miles away and the air temperature was 89 degrees F. The photo was taken over Kansas and looks towards the west or north-west.

The patch is a TVNSP patch that went up on a flight. On the back is a tape label indicating which flight and it's altitude (I don't recall which one it was).

Thanks again for your help.

Paul

4261. TV02F

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-16 14:47:27 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 3904 Message: 4261

The TV02F capsule is not lost, just currently unrecoverable. I plan to hike out there again next year and check up on it. I underestimated the height of the tree last week. The ground is very steep and difficult to walk around on.

Getting back was a little more difficult than getting there. There's a steep hill just before the creek that's tough going back up. However, Team TVNSP made it like real troopers. Thanks everyone.

If you get any other recovery ideas, please share them.

TVNSP, not just amateur science, it's an adventure.

Paul

4262. Near Space History

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-16 15:01:43 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4262 Message: 4262

For my book, I'd like to write a short section on Amateur Near Space history. I don't think anyone has written down notes on the events or time lines for amateur near space programs. So I'm looking for the dates of the formation of groups, their first launches, the first time events happened in amateur near space, etc.

Please email me any notes discussing events in amateur near space. For example, who and when was the first repeater flown? Who and when was the first ATV sent on a balloon? Did it send images from near space or was it a repeater? How about SSTV? What about camcorders? Those sorts of things.

To start off, KNSP flew a camcorder into near space on December 1997. It also flew a SSTV unit (VC-H1) in October 1998 and send SSTV images taken from the balloon during its flight. Dan Miller caught a near space capsule just before it landed in October 1998 after it made a three hour flight covering 90 miles. TVNSP recordered an entire flight on video, from launch to landing, where the capsule made it into near space (above 75,000 feet) in November 2001. I think these examples are firsts, but I don't know. Ralph, do you have notes on these sorts of things?

Thanks for your time,
Paul "amateur historian for amateur near space" Verhage

From: Randy Farley
Topic: 3904 Message: 4271

I thought about that method after i got home,but considered it too destructive for a nice healthy Pondersosa pine. If it were diseased
or an old snag,i might consider that approach.

This week end,i am going to the hills to practice on a tree of that stature with my bow and or wrist-rocket. Will do so some serious testing of line strength, line length, projectile weight and overall technique. Then i can teach Paul
how to do it since he like hiking in places "where no man has gone before".

Maybe one of the eagles in the area will think the parachute
material will be good for her nest and rip it to shreds for us ;-)

I wonder if "Spider Man" needs a job.

regards

Randy Farley

OK, i wanted your approval first. Hate to publicaly distribute photos until they are approved by the attendees. I will have to get them from home. tonight.
Actually I thought you could forward them from your school.

4275. An idea....

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-19 00:15:53 UTC
From: Tim Rynearson
Topic: 4275 Message: 4275
Attachments: 2 described; binary payloads are missing from this source WARC

For recovery of TV02F.....why not list it as a GeoCache ? For those of you not familiar with the sport of GeoCaching, it involves going out and looking for 'caches' that have been stashed at specified locations, signified by GPS coordinates, with various degrees of difficulty purposely planned into the placement. It is a sport that is VERY rapidly gaining momentum and I think that if TV02F were listed as a cache, it would be recovered quite quickly. On the difficulty rating, we'd probably have to list it as a five on a scale of one to five, and specify that the 'cache' be returned to the owner, rather than left for another 'cacher' to find, as is normally the case. Perhaps we could offer the 'recoverer' a t-shirt or some such. More information on the sport can be found at www.geocaching.com if anyone would like to look. There's also a feature on the website where a particular cache can be 'watched' and any and all comments entered concerning the cache are emailed to those watching the cache. If the group thinks this might be a good idea, let me know, and I'll get it listed on the website, since I'm already a member of geocaching.com

Tim,

What if someone attempts to recover it and get's hurt like
falling out of the 100 ft tree? Who is liable?

From: John Knapp
Topic: 4278 Message: 4279

A reminder of the TVNSP meeting Friday night at the Jade Garden in Nampa. I have the Banquet room reserved starting at 6:30pm. We can visit, discuss some business, and then have the APRS Class from Randy.

Business topics include the lost capsule, future meetings, next launch, and anything else we need to discuss.

Jeff, can you resend me the schedule again? My home PC hard drive took a dive and I lost it.

Tim,Good Idea

I thought about that too,but wondered if it would be a liability
if someone tried to climb the tree and got hurt. In this day and age you gotta think "cya" all the time. Too many people out there not taking responsibilty for their own actions and then placing the blame on someone else if something goes wrong. I'm not a lawyer,so not sure what the right decision is here. Common sense tells me this would be a fun event for geocachers,but lawyers may see it differently.

Tim, do you have an example of the most difficult geocache to
find? Like maybe hanging a cache from a cliff precipice for mountain or rock climbers.

If nothing else,the capsule location does give one a fair exercise in terrain navigation.

regards

Randy

I can't see any liability associated with this idea. This would not be a "sponsored activity" so anyone taking part would be doing so on their own volition.

Wish I could make the meeting on Friday to help come up with plan C

Plan C is a very bad idea. You don't want to tell them anything they
don't have to know. I assure you it will only complicate the matter and
will do nothing to solve the problem. Ever heard of an enviromental
impact statement.....?

The only thing we've come up with down in Kansas is the possibility of renting a helicopter pilot and hover over the tree with some sort of hook (or you might get lucky and it'd blow out). I'm envisioning a long rope from the helicopter with a hook tied about 3/4 the way down the rope. Then, you could have a ground crew that could hold on to the free end of the rope and guide the hook into a shroud line.

Just make sure the rope handlers are wearing good gloves because I bet that rope would be bouncing around quite a bit.

Someone mentioned an RC helicopter, but I doubt that it'd have enough power to do a whole lot, and it would be pretty risky for the owner to be cruising around a big tree like that.

4286. Re: [tvnsp] An idea....

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-19 19:54:32 UTC
From: Randy Farley
Topic: 4275 Message: 4286

That would probably do the job,but not real cost effective.

Jeff,how much would one cost since you are in aviation?

Of course we already have more dollars into this recovery
effort than the whole thing is worth, but it is for the cause of science and the fact it is still out there.

Maybe the Air National Guard needs a new training maneuver?

All good ideas so far.

regards
Randy

>>> zclobes@... 09/19/02 11:29AM >>>
The only thing we've come up with down in Kansas is the possibility of renting a helicopter pilot and hover over the tree with some sort of hook (or you might get lucky and it'd blow out). I'm envisioning a long rope from the helicopter with a hook tied about 3/4 the way down the rope. Then, you could have a ground crew that could hold on to the free end of the rope and guide the hook into a shroud line.

Just make sure the rope handlers are wearing good gloves because I bet that rope would be bouncing around quite a bit.

Someone mentioned an RC helicopter, but I doubt that it'd have enough power to do a whole lot, and it would be pretty risky for the owner to be cruising around a big tree like that.

I have an Ergo 30 RC heli with a .40 engine. This is one of the smaller ones and it cost $300, then I had to buy the receiver, gyro and servos, another $100 to $150. Then add $100 to $200 for the transmitter.

Estimated payload capacity is one pound.

Harry

I did ask about a helicopter and it was something like 200 to 300 dollars per hour. Sometimes you can find helicopter rides like the one in Twin Falls that gives you a tour of the canyon but there's none around Pine that I know of. The cost of the capsule is between $250 and $300. It is not cost effective to recover this capsule no matter how it's done. The only motivation for recovery would be for an adventure. I like the geocache idea. Let's discuss this at Friday's meeting. Tim, can you be there? You would probably be the one heading up that adventure if we decide to go that route.

John,

There is nothing left on the schedule that is current except
the meeting dates. These dates were not yet assigned a
training topic.

That would be me - I was thinking more along the lines of snagging it and dragging it out or getting some line to it than actually lifting it free. Model helicopters just aren't going to have enough lift.

Guess we'll just have to wait for a good wind storm. There is, after all, a parachute attached. <g>

Hmmm, I happen to know at least one person that works for the forest service (in a different state no less) so I could ask him if he's got any ideas.

Bill

p.s. Not gonna be able to make the meeting tomorrow. I'll look for an update.

Hmmm...

I wonder if it has an altitude limitation?

The current issue of QST has an article about how to build a
GPS antenna. Will this antenna work work with this GPS?

Paul

I will get Andrea to get it on the website soon....I am going out of town today for a week, but I am sure she can get it done in the very near future. Also, I need a flight synopsis of TV02F to post to the website. We have the pics of the recovery mission, just need a small write up and final GPS coordinate.

Try an arrow with a string attached shot though the parachute. Then just pull it down. 100 feet should not be too far for an arrow.

Doug W7DVR

Okay, thanks. Have fun on your trip. I'll have graphs for you to
scan.

Paul,

If those graphs are Microsoft Word documents, just email them, we can get them on the website much easier that way....

Paul,

We have Mr. Potato Head in custody at our Jail.
He paracuted in and was
taken into custody for Trespassing. Here are
some photos of him taking a
breath test, getting his mug photo taken, and in
his cell. Our address is
Dickinson County Sheriff, 109 East 1st, Abilene,
KS 67410. Phone
785-263-4081.

Thanks Undersheriff Nachtman

Actually, that's not true. It says that they are limited to 60,000ft
at speeds GREATER than 1000 knots or 1150 mph (i.e. missile!).

Mike & Andrea,
I picked up copies of the graphs that I will scan to pdf format and post
to the files area of the group site. I should be able to get this done
tomorrow (Saturday).

FYI....

Dickinson County, founded in 1857 lies along Interstate 70 in the third tier of counties from the northern border of Kansas. It has an area of 852 square miles and a population of 20,175. The county seat is located in Abilene. It's located just to the East of Salina, north of Wichita, and West of Topeka.
county map: http://www.dkcoks.com/images/dkmap4.gif
general location: http://www.dkcoks.com/images/Kansasmap.gif

trivial information, I'm sure.....

Good point, Mark.....The Garmin GPS35 is spec'd the same, and we know from
experience that the 35 will do at least 120,000 feet at LESS than 1000 knots

Actually, that's not true. It says that they are limited to 60,000ft
at speeds GREATER than 1000 knots or 1150 mph (i.e. missile!).

4313. Meeting Notes

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-21 16:13:54 UTC
From: John Knapp
Topic: 4299 Message: 4313

We have a very busy month in front of us. On Oct 19 we will do a launch with Vallivue High School. Mission control will be at the school. We will be teaching the students how to use Balloon Track, Liftwin, and predictions in general. On Nov 2 we will do another launch, this launch to use the 200 gram balloon, weather permitting. We are looking to include a Fox Hunt with this launch, one transmitter on APRS frequency, the second on some other frequency. More on that later.

Putting everything together the schedule looks like this:

Oct 4 - LiftWin and MIM. Vallivue students will be invited.
Oct 11 (date approximate). Meet with Vallivue students to go over flight predictions, etc.
Oct 18 - Preflight meeting
Oct 19 - Launch.
Nov 1 - Preflight meeting
Nov 2 - Launch
Nov 15 - Tiny Track and GPS
Nov 29 - No meeting, Thanksgiving week.
Dec 13 - GPS35. Presented by Tim R. This will be the 'In's and Out's of GPS35'.
Dec 27 - No meeting, Christmas week.

Mike, Can you do the GPS training on Nov 15?

I believe Jeff will be doing the Liftwin presentation. Correct me if I am wrong Jeff.

Some discussion was devoted to the capsule in the tree issue. It was decided not to go back in this fall, we will post it as a one time retrieval on a GeoCache and offer something in return for the capsule. I believe Tim was going to handle the posting of this. Tim, correct me if I am mistaken.

As I understand it, they are the Motorola VP OnCores. I've used
these GPS recievers without a problem. I have to purchase the
antenna seperately and build a power supply for them, however.

Jeff or John, can you run a Liftwin prediction for me? I need to know what it says if I use a 200 gram balloon to lift 1/2 pound of payload (includes parachute) with a total lift of 2 pounds (1.5 pounds positive lift or free lift). This would be a microtracker flight.

I need to know the volumne of helium, ascent rate, and predicted burst altitude.

Thanks,
Paul

Primarily John and Jeff, but for others also.

Here's the first draft of the lesson plans I've drawn up for WBALTRAK and Liftwin. Please look them over. I'll need to know the specific screens that students will input data. Perhaps I could visit this week and go over this with one of you.

4319. TV02F Flight

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-23 14:47:44 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4299 Message: 4319

Can anyone email me a screen print of the TV02F flight? I'll arrange to have color copies printed. I also updated the ascent rate graph. We had a minimum ascent rate of 1500 feet per minute with peaks around 2500 feet per minute. Next I'll run the data and relate ascent speed vs altitude so I can determine our best 10,000 foot ascent rate.

Paul

4320. Re: [tvnsp] Mr. Potatohead

From: Mark Conner
Topic: 4299 Message: 4320

To give everyone an idea of where the flights went, the GPSL launch was a few miles ENE of Herington (airport is just beyond the east border of the county) and Paul's capsule landed about 2 miles north of the town of Elmo. The flight path roughly followed Hwy 4.

Glad to see the sheriff's office has a great sense of humor.

4323. Important warning about Liftwin

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-24 02:43:07 UTC
From: Hank
Topic: 4299 Message: 4323

> Balloon Diameter 4.1 ft 4.2 ft
> Balloon Volume 36 cu ft 39 cu ft
> Nozzle Lift 1.92 lbs 2.10 lbs
> Peak Altitude 61 k ft 61 k ft
> Ascent rate 1070 ft/min 1100 ft/min
> Time to Burst 1 hr. .9 hrs
> Free Lift 1.42 lbs 1.60 lbs

I've been out of state for about a week and out of
internet contact.

As a result of two TVNSP flights, it's certain that
200 gram and probably *other* small balloon (100 gram,
300 gram, etc.) LIFTWIN results are highly inaccurate due
to inaccurate manufacturer specs. The particular categories
that are not reliable are "peak altitude" and consequently
"time to burst." A result not related to deficient
manufacturer data but nonetheless lacking in precision
is ascent speed.

Yet another version of LIFTWIN designed to accomodate
the results demonstrated by TVNSP 200 gram flight data
is in process.

Until I have better figures and to illustrate the size of
the error, those 60k feet numbers should be revised to
something like 80k feet!

If I had a chance to see what was being done as far as
number crunching *before* the ill-fated Dog Creek Flight,
I would have advised that the peak height being relied
uponn for that flight was way too low and there was almost
a certainty that the payload would stray too far north
into National Forest Service land. Unfortunately the decision
to switch to a 200 gram balloon was made very late; too for me
to chime in.

This time at least I have a chance to warn that YOU CAN'T
RELY ON LIFTWIN for small balloon flights, at least to a high
degree of accuracy such as is required to just barely stay
out of a bad landing zone (such as forested NF land or mountanous).

These computer prediction tools must be used with some
prudence and judgment. Anyone who uses LIFTWIN and Balltrak
for "pinpoint" landings (landings that demand a high degree
of accuracy for staying out of difficult recovery zones) is not
using them wisely or properly.

My view is that Dog Creek was an example of
an improper launch. I think it's highly advisable that
TVNSP formulate a written set of procedures that will
indentify and quantify weather and terrain conditions that
would prohibit a launch whose chance of recovery is low or
nonexistent.

Hank

4324. Pine Payload Rescue

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-24 04:44:23 UTC
From: Russ Dunn
Topic: 4324 Message: 4324

We had the power go out this weekend at my house after somebody took out a utility pole. The Idaho Power lineman was an expert in climbing. He changed the fuse 25' in the air by standing on the ground and using a fiberglass nesting extension pole set with each section 4' long. When asked about the stranded payload near Pine. His suggestions were:

1. Call Idaho Power in Mountain Home and ask if anyone is interested in recovery.

2. Call a tree service in Mountain Home.

Young people can scamper up trees with more agility than those of us who are...uh-hum...maturing.

Thanks Jeff.
That's about 9000 feet below Kaymont's prediction. I'll manually
calculate a prediction based on the balloon's volume doubling every
18,000 feet (in the standard atmosphere, pressure drops by a
factor of two every 18,000 feet). While this doesn't account for the
pressure on the gas exerted by the balloon, it will at least give me
an idea of where the errors are.

4328. Tiny Trak and MIM

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-24 14:55:52 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4328 Message: 4328

I've finally finished the MIM and Tiny Trak sections of my book. I've built the test boards for them, but need to test the final versions. Is anyone interested in getting a PCB and directions to make the Tiny Trak and MIM a little more near space friendly?

It's best if you have either a MIM or Tiny Trak II that you have not put together (or soldered to, in the case of the MIM). Along with controlling power to the MIM or TTII, my PCBs also provides power for a GPS35 (I'll include directions on interfacing the GPS35). In the case of the MIM, the PCB also makes interfacing sensors easier.

I'll be making a few copies of each board in a test run. If you'd like a copy, please reply back to me in email. I'm asking $5 to offset my costs.

I already have Harry down for a Tiny Trak PCB.

Thanks for your time,
Paul

4336. Re: [tvnsp] Re: Tiny Trak and MIM

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-24 16:55:50 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4328 Message: 4336

The MIM sends entire GPS sentences (you select which one). The
TT only sends a posit, which doesn't conatin as much data. Also,
the MIM will send five analog voltage levels and 8 digital values.
The MIM is much more like a flight computer, whereas the TT is
just a tracker. I haven't run either one enough to know if there's
any other issues.

Paul

> I have a question about the TT and MIM. Do both perform the same
> functions? Is the MIM just a reduced version (smaller components,
> smaller traces, etc) than the TinyTrak? Is there any reliability

4338. (Fwd) Astronaut

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-24 19:41:15 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4338 Message: 4338

From the Boise Astronomical Society.....

Alan Bean, the fourth astronaut to walk on the moon will be speaking at the Capital High Auditorium on Wednesday October 2. NASA will also have displays of a space suit, moon rocks and meteors.
Tickets are available through Select-A-Seat. Tickets are $10.00 for adults and $7.50 for students.
BAS will also have a table with our tri-folds, applications and some give away items.

I'm looking into having TVNSP set up a display.

Paul

I will take one Paul.

>>> verhap@... 09/24/02 07:55AM >>>
I've finally finished the MIM and Tiny Trak sections of my book. I've built the test boards for them, but need to test the final versions. Is anyone interested in getting a PCB and directions to make the Tiny Trak and MIM a little more near space friendly?

It's best if you have either a MIM or Tiny Trak II that you have not put together (or soldered to, in the case of the MIM). Along with controlling power to the MIM or TTII, my PCBs also provides power for a GPS35 (I'll include directions on interfacing the GPS35). In the case of the MIM, the PCB also makes interfacing sensors easier.

I'll be making a few copies of each board in a test run. If you'd like a copy, please reply back to me in email. I'm asking $5 to offset my costs.

I already have Harry down for a Tiny Trak PCB.

Thanks for your time,
Paul

4342. TV02F Record

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-24 21:45:14 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4342 Message: 4342

Between 30,000 and 40,000 feet, the TV02F capsule had as it's slowest ascent, 1625 feet/min. This shows up as a single down-pointing spike in the ascent speed graph. At about 42,000 feet, the capsule was ascending at 2350 feet/minute.

I send the results of my spread sheet analysis to Ralph Wallio.

Paul

4343. Russ and Lesson Plan

4344. Recovery Operation

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-25 03:13:10 UTC
From: Tony Barrett
Topic: 4344 Message: 4344

Hello TVNSP,

I ran into David Ritzenthaler today and told him about the latest adventure. David said he'd been too busy to keep up with the e-mail. When I told him the capsule was still stuck way up in a tree David got very excited. Turns out he has a lot of experience climbing trees like this. He has the equipment too.

David said he was looking for an adventure for this weekend and rescuing this package sounded perfect. He sounded ready to head for the hills that very moment.

Anyway, David asked me to send a message to the group requesting the details. If anyone wants to take David up on his offer to attempt a tall-tree near-space-capsule rescue, please contact him at the e-mail address above with details.

Good luck, and be safe!

73,

Tony - N7MTZ

4345. Re: [tvnsp] Recovery Operation

Topic: 4344 Message: 4345

Kudos to David for his offer to help with this. I would think that Jeff would be thrilled to get his equipment back. I believe that, along with Randy Farley's new bow arrangement, this offers the group's last/best chance to rescue the capsule this year. I understand that the gate that allows vehicular travel within a 'short' hop of the landing site will be closed on October 1 so there is no time like the present to make this happen. I only wish I was off work this weekend so I could help in some way.

Stephanie

Maybe Randy's bow shoots a line up or over so David can pull up a climbing rope.

4347. Bioenergy 2002 Conference - Boise ID

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-25 04:00:02 UTC
From: Russ Dunn
Topic: 4347 Message: 4347

This is the email to which Paul referred. There was hesitation in sending it to the group until I found out the cost. It's a mere $175/person registration fee. Monday night was underwritten by my employer and thus open to the public. 20% of the speakers are international. The last day is tomorrow. A copy of the seminar presentations may become available on CD-ROM.

Simplot Transportation operated a Kenworth 200,000 miles hauling raw potatoes on a 50/50 blend of used canola oil (french fryer waste) and diesel fuel. The experiment was funded by the US Department of Energy and local businesses. It was on display at the Idaho State Fair 4 years ago. Paul Mann oversaw the canola production and today continues to manage the ethanol plants at the Caldwell and Heyburn. Ethanol is manufactured from waste products of potato processing.

Russ (eat more French fries) Dunn
N7SMA

To: All Treasure Valley Simplot Employees

Bioenergy 2002 will be held next week at the Grove Hotel. There will be over 200 papers presented during the technical sessions on many aspects of alternative forms of energy.

On Monday evening (September 23) from 6:30 until 9:00 the J. R. Simplot Company is sponsoring Citizen's Night. During this time the posters and exhibits will be open to the public. Exhibitors at the trade show will demonstrate and present up-to-date information on technology, research and development, commercial projects and applications, and alternative fuels vehicles with be showcased.

There will also be poster presentations high-lighting new ideas and concepts in alternative energies.

During the evening there will be presentations for the public on digestion, gasification, and bio-fuels.

Citizen's Night would be informative and educational for junior and senior high school students and their parents.

Thanks,

Paul Mann

4349. 200 Gram Balloon

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-25 12:30:11 UTC
From: Jeff Melanson
Topic: 4349 Message: 4349

John the elder,

You asked me to purchase a 200 gram balloon but Kaymont has none. There was some talk of other sizes or going with Kaysam. I think we have a problem with not knowing how any of these balloons will perform and therefore would be unable to make a good prediction. If you want me to order something other than Kaymont's 200 gram balloon let me know. I won't see the email reply's until tonight and therefore can't order anything until tomorrow. If you want to get the order in progress Kaymont's number is 1-800-644-5459. Ask for Paul. He may give you a 300 gram balloon for the 200 gram price. He started to to tell me he could substitute but I didn't pursue it at the time. Kaysam's number is 973-790-3366. Since we've not flown small Kaysam balloons we really don't know how they will perform either.

If we do this, we need to do it this weekend. After October 1st, we
can't drive to the end of the trail. That adds about 3 miles to a 1
mile hike over very rough terrain.

Paul

4352. Blocked Email

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-25 14:32:35 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4352 Message: 4352

I tried replying back to Rizenthaler (sp?), but my email is blocked.
Can someone verify he's getting our messages?

Paul

4353. First Launch

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-25 14:43:13 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4353 Message: 4353

For my short history of amateur near space, I need the dates of first launch for each group. Please pass this message on to people who have launched in the past, but are no longer active.

Thanks,
Paul

4354. Motorola OnCore VP

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-25 14:49:35 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4354 Message: 4354

I used the OnCore as my first near space GPS. I still have the manuals and Basic Stamp code for controlling it. Let me know how much the amplified antennas cost. If the price is reasonable, I may purchase one for myself. The antenna is connected with a thin coax (like RG-184?). The ends are terminated with a SMA connector.

Paul

From: Randy Farley
Topic: 4344 Message: 4356

My bow setup is available if it would aid David's retrieval
method.
I am tied up this weekend so i cannot help this time.

>>> tonybarrett@sunvalley.net 09/24/02 09:38PM >>>
Maybe Randy's bow shoots a line up or over so David can pull up a climbing
rope.

At 09:28 PM 9/24/02 -0600, you wrote:

4362. Re: [KNSP] (Fwd) [EOSS] Motorola/IBM GPS chip able to fit inside a watch!

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-25 15:36:23 UTC
From: mgray@ess-us.com
Topic: 4351 Message: 4362

The only problem with this Motorola chip set is it is designed to work with the base station to provide location. The chip set only provides a portion of the required GPS processing.

However, there is a Finish company that provides a complete GPS engine that is the size of a postage stamp.

http://www.fastrax.fi

The product is shipping, works very well, and is less than $100. There is also a software development kit available that would allow you to generate APRS packets within the unit and eliminate an external processor.

The standard unit does send NMEA messages, so it will work with any standard TNC, MIM, or APRS unit. It is also well suited for battery operation because it only requires 100mW at 2.7V.

More fun toys to play with,
Michael Gray

4367. RE: Recovery Operation

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-25 20:46:28 UTC
From: Dave
Topic: 4344 Message: 4367

So the full story is, in a previous life i did a lot of glacier travel,
and thus we trained for self-rescue a lot, and the way self-rescue is practiced is by throwing a rope over a strong branch in a tree and prussicing up the rope using your own power (one horse power). http://members.tripod.com/~thede/pictures.html (search for the link to "Texas Prussic", what Texas has to do with it, i don't know)

So i currently rock climb, and have all the gear, i haven't prussiced in a while, but i still know how to do it...

I have been out to Atlanta twice this summer and it's absolutely beautiful out there, I would love to go again.

I'll have my radio on in my truck on the 146.52 unless Atlanta has a repeater that can be used in the area.

My callsign is KC7NFZ. I'll most definitely be camped by Chattanooga hot spring, also know as Atlanta hot springs. (There are two groups of hot springs within 1/2 mile of each other, i will _not_ be in the small one right by the dirt road, I'll be at the one over the cliff....)

My truck is a black ford with a gold canopy. The coordinates of the hot spring (I'll be camped within 100 yards):
NAD83 43,48.654,-115,07.015

From what I've been told, I'd better pack a hunting vest for me and my dogs!

It would be very helpful if you guys could provide the following:

1) A description of how high the craft is up the tree approximately. And an approximation of the difficulty of the tree (deciduous, coniferous, heavily branched, what's the elevation of the lowest branch... that kind of stuff)

2) GPS coordinates of the tree.

3) terrain, difficulty and distance of the approach to the tree. Could it be mtn biked?

3) A contact phone number or two I can use while I'm out there, if i have trouble finding the tree.

4) I have a 2 wheel drive F150 that does just fabulous on those roads out there are the roads to the capsule considerable worse than the roads in the general area? Am I going to have a difficult time

driving to the closest point to hike to the craft? If the road got too bad, how far would i have to walk (mtn bike?).

5) Is there a repeater that would work easily (low power) from Atlanta and the crash site? If so, let me know, and I'll be on that.

6) It's a bad idea to go out to a remote location and do technical rope work alone. I would feel a lot better about this if i had another person who could, at a minimum, call 911... :)
Russ expressed interest in going, and has some previous technical climbing experience....

Thanks all for the fun adventure!
Dave

> 1) A description of how high the craft is up the tree
> approximately. And an approximation of the difficulty of the tree
> (deciduous, coniferous, heavily branched, what's the elevation
> of the lowest branch... that kind of stuff)

It's about 100 feet up the tree. There are very few branches low,
but they get thicker about 30 feet up. It's a pine tree

> 2) GPS coordinates of the tree.

I don't have that with me.

> 3) terrain, difficulty and distance of the approach to the tree.
> Could it be mtn biked?

The terrain is very steep in places. Footing can be trecherous. At
the tree, the ground slopes about 30 degrees. It's a 1 mile hike
from the end of the road. The road is close on 1 Oct. That adds
another 3 mile hike to the trip.

3) A contact phone number or two I can use while I'm out there, if i
> have trouble finding the tree.

?

No more than three miles, on pretty level roads.

> 5) Is there a repeater that would work easily (low power) from

I really appreciate you volunteering to go after the capsule. I have not been to the tree and don't have the location of it handy, but I can give you some advice.

There are no repeaters for the Pine area (not Atlanta). We did meet a ham, Dave, call sign KG7CN. He lives outside of Mt. Home but goes up to Pine most weekends. Please contact him on 145.62, simplex, when you go up. He can give you some very good instructions to the capsule. The best way to get to it is to take Wagontown Rd, FS183, outside of Featherville. It will take you to about a mile from the capsule. The hike from the road to the capsule is rough, I seriously doubt a Mt. bike can handle it. One of the others that have been there can give a better description of the terrain. From what I understand, the capsule is about 100 ft. in the tree. It is a conifer pine, a seed tree that is about 3 ft. in diameter (not circumference). The lowest branches are about 30 ft above the ground.

Paul or Jeff, are you available to help out this weekend? Dave, when do you plan to attempt the retrieval? Saturday or Sunday?

Hope this helps.

4370. Re: [tvnsp] RE: Recovery Operation

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-25 21:30:15 UTC
From: Dave Lastname
Topic: 4344 Message: 4370

Between yours and Pauls description, it sounds like I'll be using techincal gear to simply get into the lower branches (estimated to be 30 feet off the ground). Then do some tree climbing with techincal safety and technical assistance. This sounds do-able and not terribly dangerous. I'm NOT climbing out on a small branch. So we'll have to get creative when i get to the right elevation.

Anybody know how far out from the trunk the craft is? There is zero percet chance that i'll go out on a small limb. I guess i could over climb it, and then swing out, but i'd rather not do that. (under my breath... cut off the limb? I didn't say that)

Do we have an email address for KG7CN (Dave?).

Thanks
Dave

If you have a choice of days, Saturday is probably the better one. On Sunday, there will be increasing clouds and wind through the day and a slight chance of showers by late afternoon or evening as a cold front approaches. Expect upper 30s in the morning and low 70s by afternoon either day. Saturday should be clear with light winds (< 10 mph).

Paul,
I bought an amplified antenna off of EBay a couple of months back for 40 or 45 bucks. I think they are an on-going listing from "GPSGeek". Sorry that my recollection on the price isn't any better.

Tim

Subject: [tvnsp] Motorola OnCore VP

I used the OnCore as my first near space GPS. I still have the manuals and Basic Stamp code for controlling it. Let me know how much the amplified antennas cost. If the price is reasonable, I may purchase one for myself. The antenna is connected with a thin coax (like RG-184?). The ends are terminated with a SMA connector.

4377. Re: [tvnsp] RE: Recovery Operation

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-26 02:33:02 UTC
From: Jeff Melanson
Topic: 4344 Message: 4377

Hi Dave,

I'll try to answer your questions below. I will not be able
to go with you this weekend. I hope someone can go with you,
it would be best to have a partner.

Dave wrote:
>
> >From what I've been told, I'd better pack a hunting vest for me and
> my dogs!

Yes, take a bright orange vest. There are hunters in the
area where you will start the hike. I don't think anyone has
been where we went. Also be sure to take plenty of water,
you will need it! Take a first aid kit and the other usual
safety items. We did see plenty of bear tracks.

> It would be very helpful if you guys could provide the following:
>
> 1) A description of how high the craft is up the tree
> approximately. And an approximation of the difficulty of the tree
> (deciduous, coniferous, heavily branched, what's the elevation
> of the lowest branch... that kind of stuff)

The craft is about 100 ft or a little higher in the tree.
You can't see the capsule from under the tree. The first
thing you will see is the parachute which is red and white.
The capsule is more difficult to see. It appears to me that
the capsule is cradled between and slightly above two
branches.
There are few branches down low and they have cracks on the
bottoms, moss on the tops and are obviously dead. These
branches are about 2 inches in diameter and larger. They are
spread out to far to climb. The one we could reach was
surprisingly strong. I tested it for strength and I couldn't
budge it. I still would not trust these branches. About 1/4
of the way up the tree is where the live branches start.
From that point on it looks easy to climb the branches. Not
to heavily branched. The tree is about 9 to 10 feet in
circumference at the bottom.

> 2) GPS coordinates of the tree.

Tree:

Decimal format: Degrees/minutes format:

N 43.54354 N 43 32.612
W 115.34368 W 115 20.621

Here are the coordinates of where we parked. This is the
closest you can drive to the capsule which is about 1 mile
from the capsule as the bird fly's.

Decimal Degrees/minutes

N 43.55620 N 43 33.372
W 115.33224 W 115 19.934

There was some brush that we had to drive through that was
growing into the road from both sides. There are fine
scratches on my truck but my paint is peeling anyway so it
didn't matter to me. A two wheel drive truck will work just
fine. After you park in the open area you will notice the
road seems to continue a little further around a corner. The
road ends here and a game trail gets you started.

> 3) terrain, difficulty and distance of the approach to the tree.
> Could it be mtn biked?

The only way in is hiking. A mountain bike is useless. The
first 2/3rds of the terrain is not to bad. Study the terrain
carefully as you hike in and pick the longer gentler slopes
and open terrain. Follow the game trails where possible. Be
sure to track yourself with your GPS. The signal is a little
weak so be sure to stop and get a good position update
often. The last 1/3rd gets steeper and rougher. Someone is
good physical condition would enjoy the challenge. If your
out of shape don't go. The tree is on a slope and the area
around it is open.

> 3) A contact phone number or two I can use while I'm out there, if i
> have trouble finding the tree.

Your cell phone won't work out there. Dave KG7CN can monitor
your activity for the entire hike. We contacted him from the
tree and other places on simplex and had little trouble. He
called John on the phone and kept him updated. It is not a
long distance call for him. He also kept us up to date on
changing weather conditions.
My phone number is 866-8032.
Dave has subscribed to this email list. He goes up to his
cabin on weekends. You should contact him before you leave
and make sure he will be there. If he isn't there you will
have no contact with the outside world.

> 4) I have a 2 wheel drive F150 that does just fabulous on those
> roads out there are the roads to the capsule considerable worse than
> the roads in the general area? Am I going to have a difficult time
> driving to the closest point to hike to the craft? If the road got

> too bad, how far would i have to walk (mtn bike?).

You will have no trouble driving your truck to the
coordinates I gave.

> 5) Is there a repeater that would work easily (low power) from
> Atlanta and the crash site? If so, let me know, and I'll be on
> that.

No not easily. Sometimes you can hit the .84 repeater.

> 6) It's a bad idea to go out to a remote location and do technical
> rope work alone. I would feel a lot better about this if i had
> another person who could, at a minimum, call 911... :)
> Russ expressed interest in going, and has some previous technical
> climbing experience....

I highly recommend you take a partner. No one should go
alone. If you do this it is only for the adventure. The cost
of the capsule is only about $250 to $300 and therefore it's
not important enough to take risks or spend money to get it.

Other notes:

The capsule is well packed in foam rubber and can be dropped
if needed. It was designed to take impacts. However it will
probably roll down the slope to the creek below. I suspect
it would stop short of the creek in the brush.

Don't worry about the parachute if you have to damage it to
get it out of the branches.

> Thanks all for the fun adventure!

I haven't been keeping up with what you've got for sale, but we've just finished upgrading a bunch of PC's at work. We've had a hard time giving away P133-P166 with 40-64MB of RAM. We've even thrown some of them away.

With operating systems, I'd probably try to sell them on eBay. Without OS's.... well, good luck.. :-)

Forwarding.

You guys had better exchange phone numbers fast if you are going to make this happen this weekend. If not this weekend, it may not happen at all.

Glad to play my small part.

Good luck!

Tony

It's about 5 feet away from the trunk. As soon as the parachute hit
the branches, it stopped.

4382. More PCBs

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-26 14:57:16 UTC
From: verhap@occ1.sd01.k12.id.us
Topic: 4382 Message: 4382

I have four PCBs for a temperatutre sensor array. I've used this board with my current flight computer (block 1 CC/PS) sucessfully and will try it with the MIM-based flight computer at the next launch. If anyone would like to test that board out, please let me know. It's $5 also.

I still have a block one CC/PS PCB an several flight termination units (thermal knife kits). Let me know if you'd like to experiment with those also.

All kits come with a drilled PCB and directions. I'm asking that beta testers report back any corrections or claifications to the directions. I plan to ask Parallax if they'll make the boards once my book is ready to be published. By the way, I plan to send the first chapters to them next week.

I plan to shoot the MIM and TT2 boards this weekend.

Paul

Hi Paul,

Are these the same boards you mentioned at a previous meeting for use on the digi sites I manage? If so, I'm interested in several. If not, put me down for one anyway.

You can put the temperature sensor array at the digi site. The
array has four sensors, for four temperatures.

The inputs are power and ground. Output is four voltages
representing the temperatures.

Ok, this must be something different. I thought you said you had some
boards for a single temp sensor so I could install one on each KPC-3+
equiped digi site.

I'd like one of the four sensor boards for my capsule.

Also.....

I am interested in the cut away kits. I want to start flying these on every flight and would like to make up a bunch so we could just have them on hand in flight ready configuration. Randy and I discussed an alternative way to handle the cut away task the other day which got me to thinking about these.

We can solder together some single sensors. Order some
LM335s and 1k resistors. I'll need to know how you plan to
connect the sensors to the TNC's ADC port.

Topic: 4344 Message: 4389

Jeff thanks so much, this is exactly what i needed, really appreciated.
As a sanity check, on my map the road i should use goes up Dog Creek and passes the Dog Creek Campground about 1/2 mile after leaving the Pine-Featherville road. The distance to your parking area is about 3 miles from the Pine-Featherville road, and it's about a mile walk into the balloon. This seems to corelate well with all the info i've been given.
Thanks for the advice about the water/first aid kit, i'm an outdoor freak, i have all the provisions under control, but the tought is greatly appreciated. And I'll have a pistol to protect me from the hunters... uhh i mean the bears.
If i simply break the capsle and parashoot loose, it'll just snag again a little lower, i'm going to have to cut off the parashoot, i'm sure it'll be destroyed as you mentioned, i'll try not to drop the capsel unless i have too... i mean, i'll have 3 dogs tied to the base of the tree!!!! And they might think it's a chew toy... hee hee. And yes I have hunting vests for my dogs too! I'll keep them on a leash near me and i'll have a vest as well.
Hunters... don't get me started.

Okay, looks like i have all the info I need. I'll be headed out of Boise at 3:30pm tommorow (Friday). I'll be on the 146.52 and try to hook up with whoever, specifically i'll try to contact Dave, KG7CN. It sounds like Russ cant make it friday night, he would rather get up at 6am, which is against my religion.

Jeff Melanson wrote:Hi Dave,

I'll try to answer your questions below. I will not be able
to go with you this weekend. I hope someone can go with you,
it would be best to have a partner.

Dave wrote:
>
> >From what I've been told, I'd better pack a hunting vest for me and
> my dogs!

Yes, take a bright orange vest. There are hunters in the
area where you will start the hike. I don't think anyone has
been where we went. Also be sure to take plenty of water,
you will need it! Take a first aid kit and the other usual
safety items. We did see plenty of bear tracks.

> It would be very helpful if you guys could provide the following:
>
> 1) A description of how high the craft is up the tree
> approximately. And an approximation of the difficulty of the tree
> (deciduous, coniferous, heavily branched, what's the elevation
> of the lowest branch... that kind of stuff)

The craft is about 100 ft or a little higher in the tree.
You can't see the capsule from under the tree. The first
thing you will see is the parachute which is red and white.

The capsule is more difficult to see. It appears to me that the capsule is cradled between and slightly above two branches.
There are few branches down low and they have cracks on the bottoms, moss on the tops and are obviously dead. These branches are about 2 inches in diameter and larger. They are spread out to far to climb. The one we could reach was surprisingly strong. I tested it for strength and I couldn't budge it. I still would not trust these branches. About 1/4 of the way up the tree is where the live branches start. From that point on it looks easy to climb the branches. Not to heavily branched. The tree is about 9 to 10 feet in circumference at the bottom.

> 2) GPS coordinates of the tree.

Tree:

Decimal format: Degrees/minutes format:

N 43.54354 N 43 32.612
W 115.34368 W 115 20.621

Here are the coordinates of where we parked. This is the closest you can drive to the capsule which is about 1 mile from the capsule as the bird fly's.

Decimal Degrees/minutes

N 43.55620 N 43 33.372
W 115.33224 W 115 19.934

There was some brush that we had to drive through that was growing into the road from both sides. There are fine scratches on my truck but my paint is peeling anyway so it didn't matter to me. A two wheel drive truck will work just fine. After you park in the open area you will notice the road seems to continue a little further around a corner. The road ends here and a game trail gets you started.

> 3) terrain, difficulty and distance of the approach to the tree.
> Could it be mtn biked?

The only way in is hiking. A mountain bike is useless. The first 2/3rds of the terrain is not to bad. Study the terrain carefully as you hike in and pick the longer gentler slopes and open terrain. Follow the game trails where possible. Be sure to track yourself with your GPS. The signal is a little weak so be sure to stop and get a good position update often. The last 1/3rd gets steeper and rougher. Someone is good physical condition would enjoy the challenge. If your out of shape don't go. The tree is on a slope and the area around it is open.

> 3) A contact phone number or two I can use while I'm out there, if i
> have trouble finding the tree.

Your cell phone won't work out there. Dave KG7CN can monitor
your activity for the entire hike. We contacted him from the
tree and other places on simplex and had little trouble. He
called John on the phone and kept him updated. It is not a
long distance call for him. He also kept us up to date on
changing weather conditions.
My phone number is 866-8032.
Dave has subscribed to this email list. He goes up to his
cabin on weekends. You should contact him before you leave
and make sure he will be there. If he isn't there you will
have no contact with the outside world.

> 4) I have a 2 wheel drive F150 that does just fabulous on those
> roads out there are the roads to the capsule considerable worse than
> the roads in the general area? Am I going to have a difficult time
> driving to the closest point to hike to the craft? If the road got
> too bad, how far would i have to walk (mtn bike?).

You will have no trouble driving your truck to the
coordinates I gave.

> 5) Is there a repeater that would work easily (low power) from
> Atlanta and the crash site? If so, let me know, and I'll be on
> that.

No not easily. Sometimes you can hit the .84 repeater.

> 6) It's a bad idea to go out to a remote location and do technical
> rope work alone. I would feel a lot better about this if i had
> another person who could, at a minimum, call 911... :)
> Russ expressed interest in going, and has some previous technical
> climbing experience....

I highly recommend you take a partner. No one should go
alone. If you do this it is only for the adventure. The cost
of the capsule is only about $250 to $300 and therefore it's
not important enough to take risks or spend money to get it.

Other notes:

The capsule is well packed in foam rubber and can be dropped
if needed. It was designed to take impacts. However it will
probably roll down the slope to the creek below. I suspect
it would stop short of the creek in the brush.

Don't worry about the parachute if you have to damage it to
get it out of the branches.

Hi Paul,
Yes i plan on camping in the area all weekend, leaving boise friday night. There are many hotsprings in the area, i imagine i'll camp near one of those, if you happen to be in the area friday night just look for me on the 146.52. According to my maps there are 3 hotsprings between pine and featherville.
I will be waiting for someone to be present before i head up the tree. I expect this to be around 9-11AM on Saturday. Lets just say i'll be at the base of that tree, and totally ready to go around 8:30 on Saturday cooling my heals waiting for someone to be there in case i get hurt or something.
I'm also trying to recruit at least one other climber/caver to come along for technical and safety reasons.

-Group

I'm interested in going along to retrieve the capsule if I can be of any help. I'd really like to go with someone who has already been to the new trail and campgrounds, I get lost easily. Paul, do you want to go along? I can pick you up if you'd like.

I think someone was looking for the pictures I took from the first retrieval attempt, they can be found in the "files" section labeled "TV02F Capsule and Tree" at the Yahoo groups page. Also, the coords I took at the base of the tree are N 43.54333, W 115.34350. Hope this helps any.

Justin, KD7PIT

I will take one Paul.

>>> verhap@... 09/26/02 07:57AM >>>
I have four PCBs for a temperatutre sensor array. I've used this
board with my current flight computer (block 1 CC/PS) sucessfully
and will try it with the MIM-based flight computer at the next
launch. If anyone would like to test that board out, please let me
know. It's $5 also.

I still have a block one CC/PS PCB an several flight termination
units (thermal knife kits). Let me know if you'd like to experiment
with those also.

All kits come with a drilled PCB and directions. I'm asking that
beta testers report back any corrections or claifications to the
directions. I plan to ask Parallax if they'll make the boards once
my book is ready to be published. By the way, I plan to send the
first chapters to them next week.

I plan to shoot the MIM and TT2 boards this weekend.

I can't make it this week. I have too much to do for Thursday and
Friday's Inservice. Besides, I need to shoot a bunch of PCBs.

Yes,one TEMPERATURE sensor array.
Also one Thermal Knife Kit.
Your going to have to publish a catalog of "Paul" kits
soon ;-)

I'll put you done for each.

I was thinking of calling them Near Space Kits, because Stanford University has a line called Space Kits. But that might be a problem with them. So I selected NearSys Kits. NearSys is short for Near Space Systems. I imagine the demand will be high enough that it would make sense for a board house to make the PCBs.

Do you want to set your's up for near space? There are two serial channels, a power and ground, and other wires for things like 1 PPS on the OnCore. If you decide to build either the MIM flight computer or the TT2 near space tracker, I include directions for wiring up a GPS35. But those directions can be modified to include the OnCore. In fact, with the standard I designed in my system, the OnCore or GPS35 can be swapped out.

Got this from Dave. He is at Pine and wants the
recovery personel to say high when they are up there.
He will listen for you Saturday.

JohnK
KD7HGS

Hi John
No, I'm not receiving any e-mail from the group yet,
and looking at the members list, I still don't show
up. Guess it takes time. Great on another attempt to
recover the balloon. Hope it is successful and safe.
I'm at Pine now, came up Wed to work on a log railing
for the stairs. Pam has to work this weekend so if
folks are coming up to get the balloon, I'll stay up.
Tell them to give me a call on the radio or stop by!
We are going on vacation Oct 4th and going hunting up
Wagontown loop just north of the balloon site, and get
this, I build a cabin in the woods so Pam wants to go
camping in a tent and rough it! Soooo we have a new
tent and I dug out the Coleman stove that hasn't been
used in 20 years ect.
But I'm not going to rough it completely, I got out
the generator, TV.v vcr and we will do it right.
By the way the Air Force Base life support section
uses the area N.W of Dog Creek to train air crew
members in survival, and Pam has got them thinking
about balloon rescue. See if they come up with
anything.
Also got the APRS equipment up here and should get it
going soon.
Enjoy the Fall Dave

Dave,

Just before you get to Featherville you'll take a left on a road which if I remember right is named Trinity Mountain Road. Go up this road a short distance and you will come to an outhouse. This is where FR 183 starts. Take FR 183 which is part of wagontown loop until you come to a gate that says it will be closed on OCT 1st. As you travel FR 183 you will come to a couple of forks in the road and have to decide which way to go. These forks in the road are not marked. Take the more traveled roads. After you enter the gate there is a couple of more forks in the road. You'll have to use your GPS to get you to where we parked.

I hope this helps. I think it will become more clear as you proceed.

Paul,
With all these boards you're building, you should go surface mount (even smaller in size!) and let a local company build them for you. Computrol in Meridian is a real good local source with plenty of experience and they (we) are of the philosophy that they can build 1 to 10,000.....

Subject: [tvnsp] More PCBs

I have four PCBs for a temperatutre sensor array. I've used this board with my current flight computer (block 1 CC/PS) sucessfully and will try it with the MIM-based flight computer at the next launch. If anyone would like to test that board out, please let me know. It's $5 also.

I still have a block one CC/PS PCB an several flight termination units (thermal knife kits). Let me know if you'd like to experiment with those also.

All kits come with a drilled PCB and directions. I'm asking that beta testers report back any corrections or claifications to the directions. I plan to ask Parallax if they'll make the boards once my book is ready to be published. By the way, I plan to send the first chapters to them next week.

I plan to shoot the MIM and TT2 boards this weekend.

Paul

Dave,

on a side-note (sorry, gang, for not sticking to the subject), I too am a hotsprings enthusiast but don't find any between Pine and Featherville in my hot springs book by Evie Litton. Could you provide me with the names and GPS coordinates of the ones between Pine and Featherville ?

Thanx, Tim

Hi Paul,
Yes i plan on camping in the area all weekend, leaving boise friday night. There are many hotsprings in the area, i imagine i'll camp near one of those if you happen to be in the area friday night just look for me on the 146.52 According to my maps there are 3 hotsprings between pine and featherville.

I will be waiting for someone to be present before i head up the tree. I expect this to be around 9-11AM on Saturday. Lets just say i'll be at the base of that tree, and totally ready to go around 8:30 on Saturday cooling my heals waiting for someone to be there in case i get hurt or something. I'm also trying to recruit at least one other climber/caver to come along for technical and safety reasons.

Got this from Dave. He is at Pine and wants the
recovery personel to say high when they are up there.
He will listen for you Saturday.

JohnK
KD7HGS

Hi John
No, I'm not receiving any e-mail from the group yet,
and looking at the members list, I still don't show
up. Guess it takes time. Great on another attempt to
recover the balloon. Hope it is successful and safe.
I'm at Pine now, came up Wed to work on a log railing
for the stairs. Pam has to work this weekend so if
folks are coming up to get the balloon, I'll stay up.
Tell them to give me a call on the radio or stop by!
We are going on vacation Oct 4th and going hunting up
Wagontown loop just north of the balloon site, and get
this, I build a cabin in the woods so Pam wants to go
camping in a tent and rough it! Soooo we have a new
tent and I dug out the Coleman stove that hasn't been
used in 20 years ect.
But I'm not going to rough it completely, I got out
the generator, TV.v vcr and we will do it right.
By the way the Air Force Base life support section
uses the area N.W of Dog Creek to train air crew
members in survival, and Pam has got them thinking
about balloon rescue. See if they come up with
anything.
Also got the APRS equipment up here and should get it
going soon.
Enjoy the Fall Dave

4412. 300 gram balloon

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-27 02:03:21 UTC
From: Jeff Melanson
Topic: 4412 Message: 4412

Hi TVNSP,

The 300 gram balloon is on order. $15 + $5 S&H.

Warning! We have no experience with this balloon! We don't know how it will perform and I suspect it will exceed predictions like the 200 gram balloon did. I strongly recommend a cutdown device and a landing path that allows a large error in range.

Hank intends to update Liftwin based on the experience we've had with the two 200 gram balloons but I don't know if he can do anything with the 300 gram balloons since we haven't flown them yet.

Jeff
KD7INN

4413. pictures of recovery operation

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-27 06:16:48 UTC
From: Hank
Topic: 4344 Message: 4413

I hope it might be possible to document this event
with pictures.

There would be extraordinary interest by magazines
in some good pictures showing the climbing gear in use
and the bottom of the tree.

Just for my own interest I'd like to see some pictures
that depict the rougher parts of the trail and
actually the forest service road, too.

There is a tendency for amateur photographers to
step too far back to take in the whole scene. Try
to counter that by taking some closeup pictures. For
instance showing just one person even if there are
several there.

Hank

That's a possibility. After I get a couple more tests and talk to
Parallax (they may want first crack at them since they're publishing
the book), I may end up taking them to a local manufacturer.

I've flown 300 gram balloons. the first reached 50,000 feet and the
second 48,000 feet. Payload weights were probably around 12
pounds (warning, the weight is a swag).

Also you will know you are still on the right road when you cross Trail 172. The 2-wheeler trail is marked on the left side of the road. The trail is very distinct showing much use crossing the FR 183 road. You should be within 1.5 miles of the final parking spot from that point.

BTW,there is a hot spring on the bank of the river next to the bridge between Pine and Featherville. The spring feeds into a shallow rock encompassed pool on the river bank.

Please do not go by yourself.
Good Luck.

From: Harold Mueller
Topic: 4422 Message: 4422

Launch coordinates - 36 22 45.69 / -095 49 55.22.
Time of launch (APPROX) - 10am-12am CDT
Total Wt. - 160g
Lift - Unk at this time
Ascent - 1000 - 1500 ft/mn
Descent - 1200 - 1500 ft/mn
Est. Burst 30k-35k

My time on the phone at work today is very limited and I won't be able to read email, just send a quick note. I just managed to d/l all the data to run projections for tomorrow and will start plugging it into BalTrak. We may have a mobile email connection tomorrow and will try to get a launch update posted.

I have a digital camera and i'll do my best :)
I'll also encourage russ to take lots of photos.
By the way - I did try that email address for Dave, so I hope I get
a chance to say hello while i'm there (someone said they got dinner out of him!!, hee hee).

Hank wrote:I hope it might be possible to document this event
with pictures.

There would be extraordinary interest by magazines
in some good pictures showing the climbing gear in use
and the bottom of the tree.

Just for my own interest I'd like to see some pictures
that depict the rougher parts of the trail and
actually the forest service road, too.

There is a tendency for amateur photographers to
step too far back to take in the whole scene. Try
to counter that by taking some closeup pictures. For
instance showing just one person even if there are
several there.

Hank

Hi Paul,
Yes i plan on camping in the area all weekend, leaving boise friday night. There are many
hotsprings in the area, i imagine i'll camp near one of those, if you happen to be in the
area friday night just look for me on the 146.52. According to my maps there are 3
hotsprings between pine and featherville.
I will be waiting for someone to be present before i head up the tree. I expect this to be
around 9-11AM on Saturday. Lets just say i'll be at the base of that tree, and totally
ready to go around 8:30 on Saturday cooling my heals waiting for someone to be there in
case i get hurt or something.
I'm also trying to recruit at least one other climber/caver to come along for technical and
safety reasons.

Being 100 feet off the ground this seems like a pretty intese/jarring movement.
I'm going to drag it over to me, lower the capsle gently (i have several hundred feet of 200 lb kite string) and put the parashoot in my pocket!
Sudden movements, and coordinated throwing of a long complex object is a very difficult under these conditions.
Tony Barrett wrote:Dave,

If you break it loose you might be able to wad up the parachute and throw
it away from the tree so the chute opens again on the way down. If you
throw it far enough it won't snag a little lower.

Paul
The lesson plan on WBALTRAK was pretty thorough.
Only thing i did not see was any mention of when to
use the AVN model.

Liftwin 0.3
You mention "parachute Weight" on second page as one of the input fields ?
I could not find where to input this weight.
Thought this was part of payload.

The actual inputs that you have control over in the program
is somewhat confusing to me. You start with Balloon type,then jump to payload weight and
dont cover the other menu
bars such as Site Conditions, etc.

I'm more of step by step (with numbers and pictures) in a logical manner type guy i guess.
The program is probably more intuitive to the sharper folks than me ;-)

Hope this helps.

regards

Randy Farley

I'll work on the lesson plan this weekend to address these issues.
When completed, the plans will give step by step instructions. I
don't have the software installed, so I don't know the fields etc.

Paul,

I had an idea you didn't have the software and were just guessing or going by a distant memory.

Randy is correct that there is no parachute weight field in LIFTWIN. Otherwise what you've written is pretty good, but it could stand some polishing.

I would much prefer that text such as these lesson plans be posted on the TVNSP list in plain text and not any commercial word processor's format. Not using plain ascii just makes it more inaccessible and there is no good reason to post it in anything but plain ascii anyway.

Hank

4431. LIFTWIN lesson plan in plain text

Topic: 4299 Message: 4431

Amateur Near Space Software Lesson

Goal
To Become Familiar With Amateur Near Space Software

Objective

To Learn How To Use LIFTWIN To Predict Balloon Ascent Rates,
Burst Altitudes, And Needed Amount Of Helium

Software Notes

A. Where To Get A Copy Of The Software
The LIFTWIN software is available from http://www.eoss.org
LIFTWIN is a program written by Hank Riley. Originally written
in BASIC, Hank has since written the Windows interface to the
program. He makes updates to the program as needed.

B. What Does The Software Do?
Given a balloon size, a payload weight (including parachute weight),
a starting amount of helium, and additional increments in the amount
of helium, LIFTWIN makes a prediction on the free lift of the
balloon, its ascent rate, and maximum altitude.

C. How Does The Software Do It?
The maximum volume of each balloon is specified by its manufacturer.
The lift generated by a volume of helium is determined by the amount
of air the helium displaces (see Chapter Ten, Good To Know).
From the lift generated by the helium, the volume of the balloon,
the balloon's drag, and the weight of the payload, the ascent rate
of the balloon can be determined. From the initial volume of helium,
the pressure of the atmosphere at different altitudes, and the
maximum volume of the balloon, the altitude at which the balloon
bursts can be determined.

D. What Are The Inputs To The Software?

LIFTWIN needs the following inputs

The balloon type to use
The total weight of the payload the balloon is to carry
The starting volume of helium the user wants to begin with
The additional increments of helium to test
The maximum volume of helium to test

All of these fields are input by the user, no data needs to be
downloaded.

E. Where Do You Get The Data To Input?
In the case of LIFTWIN, the user determines the conditions to test. LIFTWIN is a tool for satisfying the user's curiosity. The results indicate the appropriate balloon and volume of helium to use for a particular mission.

F. Inputting Data
After starting the program, the following fields are displayed. In these fields enter the data as explained.

Balloon Type
The various manufactures (Kaysam, Totex, etc) of latex weather balloons are diaplsyed along with the designations ofg their balloons. Typically the designation indicates the weight of their balloons, so use a Totex15 for a 1500 gram Totex balloon

Payload Weight
This is just the weight of the near space capsules and any beacons

Parachute Weight
Here is were you enter the weight of the parachute

Initial Volume Of Helium
LIFTWIN generates a table indicating, free lift, ascent rate, and maximum altitude for a ranghe of helium volumes. The beginning of the range of helium volumes is determined by this field.

Increment Volumes
The number of measurements calculated depends on the incremental volumes specified.

Maximum Volume
The end of the range of volumes to calculate is determined by this field

G. Understanding Outputs

The table generated by LIFTWIN looks like the following

Balloon Diameter Volume Free Lift Ascent Rate Burst Altitude

For each increment of helium you see the ascent rate and maximum altitude the balloon should reach before bursting. From this table can select the appropriate balloon and amount of helium needed for a near space mission. The ascent rate and bursting altitude from this table are used as inputs to the WBALTRAK program.

Date: 2002-09-28 19:32:27 UTC
From: Harry M
Topic: 4438 Message: 4438

Just a quickie....

ORB-1 was last heard 360 az / 40 el from Chelsea, Ok at approx. 12:30CDT. Signal was getting weak so I assume it was still climbing
and in the strong upper winds and outrunning me. It was on a line from Tulsa through Joplin, Mo and beyond. It is possible that is
still aloft and floating.

Harry

Hi Dave,

I just checked my email and found this good news! It's good
to hear the capsule has been rescued. Have you heard
anything else? Is Dave out of the tree and perhaps back at
camp?

From: Harry M
Topic: 4440 Message: 4440

ORB-1 Found!

It's Saturday, 5:30 pm CDT. I get a call and a gentleman says, "You know anything about a balloon?". I felt like giving a little Homer Simpson laugh! As it turns out this farmer just returned to his home in Chelsea from the Tulsa State Fair and sees a weird looking package just off his driveway. He takes it into the house to show his wife and she says, "You think we ought to have that thing in the house?". The placard I had on it said, "HARMLESS INSTRUMENT CALL (my area code and number) COLLECT". He was very interested in my explanation about the payload and Amateur Radio. I will return to Chelsea tomorrow to meet him and retreive ORB-1. It seems that the balloon was on its way down at my last fix and in the process of changing location it landed. At that position I was 8-10 miles down range and unable to hear it. I did take some back roads in the direction of my last fix to see if I could hear it, but had no luck and gave up the chase at 1pm CDT. As it turns out I was less than 2 miles from the landing site.

The balloon was only inflated to 24" and at the lift was 5 ounces as weighed at the launch site. This was way less than anticipated. I was the only chaser out there and I did see some pretty country. The track was about 28 miles and quite a bit north of the prediction. One of the disadvantages of being in Tulsa is there is not any good wind data available. Norman, Ok, Lamar, Ok, Springfield, Mo, and Little Rock, Ar are the closest sounding stations. Lamar's data is not always available and Little Rock is way off from what I've seen.

All in all it was a good day!

From: Harry M
Topic: 4440 Message: 4442

Hi Jeff,

I do and I will send the pics to your email addy. I don't think I can attach on the list here.

The capsule is 1/2" thick pink Owens-Corning insulation foam, laminated to make it 6"x6". I only had the 1/2" stuff laying around.
It does come in 2" thickness. I sprayed the mating surfaces with light coats of 3M Super 77 adhesive and stuck all but the center
two together. Between the two center pieces and close to the bottom I made a cutout for the 2 chip xmtr and 9v battery. The positive
lead of the antenna was routed through a stiff plastic control rod that is used in model rc planes and protrudes out the top of the
package. The negative lead of the antenna is just left to hang out the bottom. At launch I open the two halves, plug in the battery,
close it and tape it. It is mostly self righting and will float. We have a lot of lakes in NE Oklahoma. The flight today over flew
one of the big ones and landed just 8 miles beyond it.

Hi Group,

Just wanted to let everyone know that Ben and myself made it home alright, around 8:30pm. We did recover the capsule and it's currently sitting at my house. I took 54 pictures total, using all 4 diskettes that I had, but Russ took quite a few also. Tomorrow I need to take out the buffer and give the rig a quick rubbing, the last part of the road really left an impression....on the paint! Glad to be able to go out there, meet a few more hams, and finally close the chapter on TV02F.

Justin, KD7PIT

Kudos to everyone that helped with the capsule recovery: Dave, Justin, Ben, and Russ (I think I have everyone). Especially Dave, the tree climber.

It is nice to be able to close the chapter on this flight.

Don't forget the meeting Friday night at the Jade Garden.

Jeff, the capsule looks to be in the same shape as the day you let go of it. The only thing I noticed was the pink on the capsule appears to have some slight sun fade to it. It will be interesting to see the data on the termocrone you put in it. If you can send me a personal email address to J_Formolo@..., I will take a few pictures here and send them to you. Dave, KG7CN, had a good idea for your capsule that he brought up. The capsule had no identification anywhere, so maybe have your callsign sewn onto the side or something.

4455. Future Tree Rescue Aid

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-29 17:47:31 UTC
From: Tony Barrett
Topic: 4455 Message: 4455

Hey Gang,

What about a second cut down device on future flights between the parachute and the capsule? Then when he parachute gets caught in the tree we just send the command to release the payload.

We've seen the gear (most of it) survive 60,000 foot falls without parachutes. 50 feet can't be that bad if we're standing there with a net and hard hats to catch it. Probably has lots of drawbacks, but something to think about.

Sneak Peek

Enlarge image
360° Product View

More screens info >>

> Peer-to-Peer Positioning
This patented technology makes it possible to transmit your location to a friend or family member, showing them the distance and bearing from your position to theirs on a Rino display. This could be a life-saving feature in an outdoor emergency by helping rescuers pinpoint your location-or it could be used simply for rounding up the family at an amusement park or ski resort.

GPS-Integrated FRS/GMRS Radios
GARMIN International is proud to introduce its first two GPS-enabled handheld devices for the Family Radio Service (FRS) and high-performance General Mobile Radio Service (GMRS) markets - the Rino 110 and Rino 120. These GPS devices integrate radio functionality to provide two-way communications up to two miles using FRS channels and up to five miles using GMRS channels.

Inspired by the distinctive offset FRS and GPS antennas that give the devices their Rhinoceros-like appearance, GARMIN designed the Rino series as powerful, robust Radios Integrated with Navigation for the Outdoors. They are also the only waterproof two-way radios on the market.

What really separates the Rino from the rest of the FRS herd is the ability to "beam" your exact location to another Rino user within a two-mile range using the FRS spectrum. This important feature is called Peer-to-Peer Positioning (see box at right for additional information).

The Rino boasts GARMIN's traditional tough, lightweight, waterproof design to handle the rigors of any outdoor adventure. And because the Rino has standard FRS capabilities, you can talk to friends or family who own conventional FRS radios.

Rino 110
In its bright yellow case, the Rino 110 offers standard FRS features like 14 channels, 38

squelch codes, and external voice activation (VOX). It also incorporates GARMIN's powerful 12-channel GPS receiver for position accuracy of less than 10 feet when enabled to receive enhanced GPS data from the Wide Area Augmentation System (WAAS). The Rino 110 has standard navigation features like extensive waypoint storage, TracBack technology, multiple position formats (including MGRS and Loran TD) and a built-in trip computer.

(Suggested retail price: $194.27)

Rino 120
The olive-colored Rino 120 takes all the features of the Rino 110 and adds a basemap of North and South America that includes major cities, highways, thoroughfares, rivers, lakes, coastlines, state and national borders, and railways. The Rino 120 has eight megabytes of internal memory for downloadable cartography from GARMIN's exclusive line of MapSource CD-ROMs - providing topographic, bathymetric, and street-level map information. It also incorporates a voice scrambler for secure communications and a vibration mode for "silent" calls from other Rino users.

(Suggested retail price: $267.84)

Other specific features of the Rino 110 and Rino 120:

a.. Ergonomic design for one-hand operation, with Call, Press-To-Talk (PTT) and Mode buttons on the side, Power/Backlighting button on top, and dedicated map zoom buttons in front
b.. Centrally located "click stick" allows for channel selection and volume adjustment in FRS mode and quick map panning, enter and selection functions in GPS mode
c.. Quad-helix GPS antenna and 12-channel parallel receiver for accuracy of 20 feet or less in normal mode, 10 feet or less when WAAS-enabled
d.. Waterproof construction to IPX-7 standards (immersible in one meter of water for up to 30 min.)
e.. Storage of up to 500 waypoints, with graphic identification, and 20 reversible routes
f.. More than 10 position formats and over 100 map datums
g.. Trip computer with speed tracking, sunrise/sunset read out, trip timer and trip distance
h.. Clock, stopwatch and alarm functions
i.. High-resolution display with 160x160 pixels
j.. Battery life of 15 hours (typical use) on three AA batteries
k.. Backlit display
l.. Lightweight design: Rino 110 weighs 8 oz.; Rino 120 weighs 8.5 oz.
The Rino 110 will ship standard with a lanyard, belt clip and user's manual. The Rino 120 package will include all that is offered with the Rino 110, plus a PC interface cable.

Canadian customers: Units sold into Canada will only use the FRS channels. The GMRS channels will not be activated. Canadian models are pending formal Canadian government approval and will not be available until November.

Rino 110/120 Expected Availability: September 2002

Not likely. The heat is very localized, and we can melt the cord at a much lower temperature than you can ignite wood (451 degrees F). And if we really are worried about this we could go with a mechanical cut-down device like a spring loaded guillotine blade with a solenoid release.

From: Harry M
Topic: 4460 Message: 4460

I drove to Chelsea, Ok today and met the gentleman who found ORB-1. He was very nice and even placed the package as he found it
yesterday. It was intact and still xmt'g. I have pics to be posted, but technical dificulties are preventing me from U/L them. My
ISP tech. sup. will work on it tomorrow.

On my way home one of the HAM's who helped briefly yesterday asked me to detour to his QTH. He made a sizeable donation of helium. I
left with 10-10 lb tanks and 11-5 lb tanks. Tha't's all I had room for. There are still 20-10 lb tanks and as many 5lb tanks left
that I will get at another time.

It has been a good weekend!

Hey Zack,

Not certain about this time, but I think it was hanging just by the parachute. Of course, next time, it could be hanging just by the chute, or all the lines could be tangled, but an under chute cut-down device would give us an option we didn't have this time.

I'll have to check with Dave, the tree-climbing-rescuer, to know how it was snagged. I think the people that first saw it said it was just hanging by the chute, but can't be sure.

73,

Tony

4462. Re: [tvnsp] Future Tree Rescue Aid

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-09-30 02:03:00 UTC
From: Jeff Melanson
Topic: 4455 Message: 4462

Hi,

Well have to ask Dave to be sure but when I was it from the
ground it looked like it was hanging by the load line.
This was a 2.3 pound payload and adding a cutdown device
with a reciever for remote control would add to much weight
for the 24" parachute. In addition the capsule would simply
have fallen into the branches below it.
A better use of cutdowm devices on larger capsules is to
terminate the flight when conditions call for it.

Hi all,

The name of the file has changed. I uploaded four pictures to the files area under the folder of TV02F. Thanks Justin for the pictures.

Attached is one of the pictures for those of you who can't get to the yahoo files area.

Thanks! Can't wait to see the actual recovery effort. We're sure glad you were able to get your equipment back Jeff.

Hank - Have you been able to figure an error factor based on the two flights with 200gm balloons? It seems like you might be able to work from the starting data and the known burst altitude to figure out how far off the burst volume is.

Bill

4466. Re: [tvnsp] TV02F Recovered

Great Job everyone.
Can't wait to hear Dave's side of the story now.

>>> J_Formolo@... 09/28/02 09:44PM >>>
Hi Group,

Just wanted to let everyone know that Ben and myself made it home
alright, around 8:30pm. We did recover the capsule and it's
currently sitting at my house. I took 54 pictures total, using all 4
diskettes that I had, but Russ took quite a few also. Tomorrow I
need to take out the buffer and give the rig a quick rubbing, the
last part of the road really left an impression....on the paint!
Glad to be able to go out there, meet a few more hams, and finally
close the chapter on TV02F.

Justin, KD7PIT

Here's the updated lesson plans for Liftwin and Balloon Track.
Please look them over and make recommendations. John the
Elder and I whipped them into shape on Saturday. Thanks John.
We ran through the whole process of installing the software to
using it to make predictions. The idea was to look for gotchas and
make sure the directions were complete enough for a first timer to
make a useful prediction.

From: verhap@occ1.sd01.k12.id.us
Topic: 4477 Message: 4477

I have a few more PCBs and documentation to get rid of. I have 2
more temperature sensor arrays, 1 block one CC/PS (which I think
Don is interested in), and 3 flight termination units (thermal knives).

I'll have 4 more beacons this week to get rid of also. The beacons
send CW over an HT. You can program them to send data
constantly or after a delay. There's two boards in a kit. One is
stand alone and uses a Stamp 1. The other is made to be used by
a flight computer.

If you're interested in any of these, please let me know. They're $5
and you need to give me input on the dseign and documentation.

Question for kd7pit -

I see you uploaded a log of the tv02f flight , was this a data dump from the etrex ? how did you do this ?

also, the etrex manual mentions the battery saver mode, but doesn't tell you what it does (ok ok, it saves batteries, but how much does it degrade performance??), is there a source of etrex data that surpasses the brochure that came with it ?

I snagged it with a branch i broke off, and pulled the craft too me, and the load line was just barely snagging the branches, (probably the poped balloon getting stuck in the branches). It only took a gental pull and it just came free. A second cutdown device seperating the parashoot would have worked in this case.
There is a good picture of the craft hanging in the tree in TVNSPF-RESCUE directory under "files".
sorry for the spelling, in a hurry :)

4489. Re: etrex questions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-01 04:20:22 UTC
From: Justin Formolo
Topic: 4481 Message: 4489

Hey there Mark, I think I can answer your questions.

> I see you uploaded a log of the tv02f flight , was
> this a data dump from the etrex ?

First off, I use a eTrex Vista and I believe the other models of the eTrex family may have different options but I'll tell you what I know about the Vista. Yes, the map that I created was the data collected by the eTrex as I wondered aimlessly through the forest. It's the data collected by the eTrex of my exact path I took. First of all, you need to enable the "track" option on the GPS in the main menu screen, sometimes referred as a bread crumb trail. After you have finished whatever venture you do, I like to turn off the track and then save the track to memory.

>how did you do this?

Ok, now to make the map like I did with Street Atlas, you're going to need a data cable, one with the e-plug on one side and a DB9 on the other. Plug in the GPS, then plug into the COM port. Turn on the GPS and make sure the "interface" is in GARMIN mode. This is found in the main menu and then select the "interface" icon (refer to manual if you are getting confused). Now start up Street Atlas. I use version 8 but I believe older versions will be the same. Open up a new map. Now click on the "GPS" tab in the upper left. It will bring down a menu. Click on "initialize" and a window will pop up that will ask you to select your device. I use "Garmin/Garmin" for the etrex, then select the port your cable is connected to (for me, its COM1). After you do this, click finish and now Street Atlas will look for your GPS. At this point you won't care if it can find a GPS satellite fix or not, I usually just click on the red stop sign to stop tracking. You know your GPS is connected when is says "no fix" or something like that. What you are really wanting is Street Atlas to recognize you have a GPS connected.
After you get this far, you are ready to download your data. Now if you notice, on the map I made, it has both waypoints and the track. These are two separate things on the eTrex. Waypoints will be things such as a balloon capsule or where you parked your car (in the case of the map I made, it was Jeff's capsule and where Deb was hurt; both manually entered waypoints), and the track is the trail you navigate between them (which is automatically entered by the GPS). Getting back to the map, you need to click on the "GPS" tab again and bring down the menu. I like to download waypoints first so click "Download waypoints from GPS" and it will begin to extract all your waypoints from the memory. After its done, you will see your map fill up with waypoints. Now, go back and do the same menus again

but click on "Download tracks from GPS." It will then extract your saved track from memory and then display it.
If you have got this far, your just about done. Now that all your data is downloaded, find your track on the map and zoom in on it. You might need to change the track color to make it a bit more clearer to see. When you get the zoom/view the way you want on the screen, just push the "print screen" button just right of the F12 key. What this does is take a snapshot of what you see on your screen at that point. Now go to Window's Paint program. Usually click on the "Start" tab, then Programs > Assessories > Paint. When you get here, click on "edit" then "paste". You should have your new map on the Paint program. Now you can save it. One problem I see with using MS Paint is that the file can be very large, sometimes 3+ MB's for a single picture in a Bitmap format! I use an additional "photo shop" program to save it as a JPEG. Makes for a smaller file, usually 300kB. I think I have everything covered for this question, I think.

> also, the etrex manual mentions the battery saver
> mode, but doesn't tell you what it does (ok ok, it
> saves batteries, but how much does it degrade
> performance??)

What I have found with using the "saver" mode is that your GPS fix updates are slower. When the eTrex runs in "normal" mode, it updates as soon it receives position data, the "saver" mode updates every few seconds or so. When you have your track on, it makes a messy, not so smooth of a track, and in the thick tree canopy of a forest, you will want any and all info it can grab. I find that it's not worth it to "save" the batteries when compared to a very smooth track, especially when you're in the middle of nowhere and your lost. If you use the Backtrack feature, it becomes a whole lot easier to navigate back. Besides, I always carry spare AA batteries. For this latest rescue over the weekend, I went through two sets of batteries in the field.

>is there a source of etrex data that surpasses the brochure that
>came with it ?

Never really looked, I've always known what I know by just playing around with programs and some-how click the right combination of buttons to make things work. I'm sure you could search for anything you want at a place such as Google.com

> 73's de KMC kc0jhq, Denver

Hope I provided you with the answers you needed. I didn't mean to be so long winded, I just wanted to be thorough and percise. That's how I need information displayed for me, step by step instead of a "just figure it out" reply. If you need any addition info or if I missed a step, just holler back.

73's de Justin, KD7PIT

Date: 2002-10-01 16:06:04 UTC
From: Harry M
Topic: 4496 Message: 4496

I found 4, 2300g Kaymont Surplus balloons yesterday. I bought 2 and can get the other two if anyone is interested. Of the two that
are left, one is still sealed and the other one the plastic bag has been partially opened, but it is only a small hole (2") and the
balloon seems to be ok. It had not been removed from the bag. They all seem to be soft and not stuck together or any signs of
degradation. The boxes are in excellent shape. Below are the specs. from the label on the box. Price is $40 plus shipping which will
be around $9.

Harry

From the 6th field down, it looks like these were manufacturer in
Sept of 1985. They're old enough that they may leak.

From: Harry M
Topic: 4499 Message: 4499

Is anyone going to be at AirSho 2002 http://www.airsho.org/ in Midland, Tx this coming weekend?

I will be staying at the Midland TraveLodge (Fri,Sat,Sun,Mon) and will be at the airport doing Pyro with the Blastards,
http://www.blastards.com/ from 6am to about 8pm both Sat and Sun. At lunch (?) and after the shows I will be at the Sky High hangar
just south of the CAF Hq building. I will be monitoring 2m 146.520 simp. and FRS chan. 10 with quiet code 10. If you have extended
receive on your radio covering the aircraft band it is a real treat to listen to the Air Boss. I am not sure of the freq. but just
ask any of the line marshals (yellow coveralls) or a member of the Blastards, EOD or Tora pyro groups.

Can you feel the HEAT?

Harry

Harry,

Be aware that these are not eqivalent to regular
Kaysam or Kaymont balloons in that they have an
extra rubber streamlining "skirt" that contributes
to the 2300 gram weight.

Just how much the skirt weighs I can't tell you, but
the gas carrying envelope is substantially smaller
than 2300 grams.

Pierre of HamBONE has used a couple of these so
far, probably of the same old vintage. They are
made by *Kaysam*.

Justin,

I noticed your saved SA map was a jpeg. You should be
saving simple graphics like that to a gif (or png) file.
Instead of 300k it might be 30 or 40k!

Jpegs are suited for photographs or very detailed graphics.

Hank

Paul,

You still don't have all the fields for LIFTWIN,
and you're still apparently using the now obsolete
0.2 version of the software.

I'll correct the plan and submit a revision to you
tonight.

Good point Hank, but the closest I can get with my photoshop program is a JPEG format. Also, I sometimes have problems viewing GIF pictures. I'm sure this isn't a universal problem, it's just my computer being difficult.

Space Weather News for Oct. 2, 2002
http://www.spaceweather.com

A solar wind stream buffeted Earth's magnetic field on Monday, Oct. 31st,
and triggered a strong geomagnetic storm. Sky watchers spotted colorful
auroras all the way from the Bering Sea to Arizona. The interplanetary
magnetic field near Earth is still pointing south, which weakens our
planet's magnetic defenses against solar wind gusts. As a result, more
auroras are possible on Tuesday, Oct. 2nd. Visit spaceweather.com for
updates and for pictures of the Oct. 1st Northern Lights.

Walmart in Caldwell is now selling their photo-lithiums for $10 a pack of four. These cells come in the AA form factor and habve a capacity of 2900 mAh. They operate to temperatures as low as -60 deg F.

It's a good buy on a good battery.

Reasonably so, yes. There will be some influence from the lights due to dust
and such, but it's minimal enough that the site should be doable.

I have the following printed circuit board kits left over. I'm asking $5 for each and a committment to email me nback with an evaluation on the design and directions.

Three temperature sensor arrays
(allows you to measure four temperatures remotely with the flight computer)
Three thermal knifes
(will cut away a balloon or reef a parachute)
One Tiny Trak based tracker
(good as a back up tracker)
Two HT beacons
(good as a DF setup - there are two different baords with each kit)
One CC/PS
(uses the BS2p as the flight computer)

I also have a 1/2 completed CC/PS. You'll need to add a voltage regulator, servo controller, ICs, can cables. Email me if you're interested.

The northern lights were visible from Boise last night (Specifically my hot tub... gloat gloat). It was a green glowing from the north with occasional lines going south (green). And sometimes it was a deep red above the green. This would have been about 10:45pm for several hours.

Rick Widmer wrote:

That's correct. I think it's okay now to make it
the web page software since it doesn't seem to have
any known bugs after being on trial for a few months.

In my opinion, JPG is the best quality for size.
You do have to take care when doing the conversion though, there are many different levels of compression with jpg. These directly affect the quality and size of the image. I generally use 3 or 4 (out of 10) for this group, it keeps a 7x5" image to about 30-50K which is really good. But for "home use" i use 7 or 8 (out of 10), and the same image would then be about 100-250K.
JPG is great, if you use it with the right settings (if your software even allows you the option to change the compression level). Just play around with it, take one image and save it a bunch of different ways, and see if you can tell the difference.

Good point Hank, but the closest I can get with my photoshop program
is a JPEG format. Also, I sometimes have problems viewing GIF
pictures. I'm sure this isn't a universal problem, it's just my
computer being difficult.

Different levels of jpeg compression equate to different
levels of image quality losses. That is the key point with
the comparison of jpegs vs. gifs.

Gifs are *totally lossless*. There is *zero* image quality
degradation with a gif (the original image must be 256 colors
or less or be limited to that number when converted to a gif).
Even with that zero loss, the gif uses less bytes to describe a
graphic compared to a jpeg, maybe even a jpeg at the highest level
of jpeg compression (which means noticeable image distortion),
particularly noticeable around sharp image density changes such as
lines which is exactly what a graphic is apt to be full of.

It is a commonly accepted fact that gifs and pngs are the choice
for graphics with large areas of the same color and lines.

Conversely, jpegs are the choice for photographs with their
rapidly changing pixel color values.

I would challenge anyone to make an acceptable looking jpeg
version of any of the several gif maps I've posted to TVNSP
that uses less bytes. I don't think it can be done.

I would like to take Justin's SA image and gif it, but that
will not work properly since the image is already compromised
by its rendering as a jpeg (the jpeg adds "artifacts" that
gobble up gif bytes). However, any gif file can be properly
changed into a jpeg.

4524. GIFs and JPEGs / was Re: etrex questions

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-03 00:49:04 UTC
From: Hank
Topic: 4481 Message: 4524

Simple rule: graphics such as low complexity Street Atlas
maps, data graphs, line drawings and diagrams, schematics
from a drawing program (not scanned) -- use GIF.

All others, especially photographs, use JPEG.

The following is taken from an image FAQ:

GIF

GIF is best for images that have solid colors, text, and line art. It is good for computer-generated images, such as those produced by a drawing program like Corel Draw. It is also best when the image has detail, like text, where every pixel (dot on the screen) counts. It does well with images that are made up of a limited number of colors. It does not compress photographs very well, especially images that show texture or color gradations, or that are 24-bit color. GIF is a "lossless" form of compression. Every pixel in the original image is preserved.

JPG (JPEG)

JPG is best for photographs, and scanned photographs, of natural images. JPG gets its good compression by doing approximations, and is not as good for images where every pixel counts, or when you can get compression by using less than 24-bit color. It is usually a "lossy" compression, where you do not get back every pixel exactly as it was in the original image. There are different levels of JPG compression, ranging from little loss of detail and poor compression ("higher quality") to possible loss of detail with great compression ("lower quality").

4525. Re: [tvnsp] Re: etrex questions

Yahoo group: tvnsp (2000 — 2002)

From: Zack Clobes
Topic: 4481 Message: 4525

I'm not terribly familiar with the PNG format, so I won't comment on that but there are some very important differences between GIF and JPG formats and how they pertain to various graphics.

First off, the color depth of a GIF is limited to 8bits or less. This means that you only have 256 colors (or less) to work with and any shades in between will become dithered. Often times when working with simple graphics such as maps, cartoon images, drawings, etc, much smaller file sizes can result by simply limiting the number of colors used - often without any noticeable change in the overall image. For example, on Street Atlas files, I usually wind up using only about 16 colors in the files. JPG images are capable of at least 24 bit (true) color which makes them much more suitable to photographic images.

Secondly, the compression algorithms are vastly different between the two types. GIF compression likes long horizontal stretches of a given color. It apparently compresses by stating that there are x pixels of red, then y pixels of green, etc... GIFs will compress an image of horizontal lines very efficiently, but will have a very poor compression of an image full of vertical lines.

JPG files on the other hand, compress quite differently. In the example used above with the lines, a JPG would compress the vertical an horizontal images roughly identically. However, especially on the image of vertical lines, you would notice a "ringing" of the vertical line to the right of the actual line. This is just compression noise and is found in all JPG's, but is seldom noticed with photographs because strong, hard lines of highly contrasting objects are less frequent (as opposed to a map for example).

The GIF is considered a lossless compression - every line drawn on an image will be saved in the GIF format exactly as drawn, as long as it is within the 256 color range. A JPG format is considered a lossy compression because some data is lost (or distorted by the compression noise).

One problem with the GIFs however, is they have a very restrictive licensing agreement. I have a feeling that it is seldom enforced by the number of freeware/shareware software vendors that include the format, but technically any program that saves GIF files is required to pay some organization a sizable chunk of change - if memory serves me, this chunk is somewhere on the order of $100 per software client (i.e. $100 for every copy of PhotoShop sold).

Yes, from a FAQ again:

The PNG image format was designed in 1995 specifically in
response to the patent problems with the LZW algorithm used
in GIF. To the best of the PNG group's knowledge, PNG was
then--and still is--completely patent-free.

4534. Re: [tvnsp] Tree climbing

Yahoo group: tvnsp (2000 — 2002)
Date: 2002-10-03 15:08:11 UTC
From: Dave Lastname
Topic: 4523 Message: 4534

I had a bunch of kite string, and just tied a rock to the end. After 10 tries i got the kite string up over some good branches, and pulled the climbing rope up. Then tied one end of the rope to the "anchor.jpg". You can see a picture of then thin pink line going up the tree... .then i prussiced up the rope... once in the tree at a level where i could actually use the branches (they were very dead and crispy lower) i had a system of lines where i would attach myself to many different branches all at one time.... thus, if i fell, i had between 3 and 4 saftey lines in place at all times. it was a very slow climb. the first 30 feet (the prussicing) took 40 minutes and was very very strenuous. Then the rest of the climb took about 50 minutes. In my approximation the capsle was about 90-95 feet off the ground. Moving so many safety lines around constantly was time consuming, and sometimes there werent so many branchs around to climb on, so i had to get creative 3 times..... basically setting up systems of webbing to assend with.... Anyway, I left the ground just a few minutes after Russ, Justing and Ben left the car to hike in. I hit the elev of the capsle at exactly the same time they arived at the tree. I estimate it took 100 minutes to go up (and for them to hike in + 10 minutes). It took a few minutes to lower the capsle, and the guys tied some water on the kite string after i lowered the capsle, and i was able to raise some water and drink (i was parched). Then 10 minutes of rigging and moving stuff around, and then i rappelled down. The picture "superdave.jpg" is actually a rappelling (desending) picture, truth be know!
When i hit the ground, my left hand went into very very bad spasms.... the fingers curled up into a tight fist, and it was very painfull. my middle finger, on the same (left) hand freeaked out on me when i got to the top. It had a lot of spasms. but i was able to keep it under control and finish the climb. but 20 feet off the ground, on the descent, i had to wrestle aggresively with some huge branches i was tangled in, and my entire left hand basically had a can-nip-sion (don't know how to spell that). But after 5 minutes of rest and some massage, and fluids and food, the left had is fine. I've never had that happen in all my years of climbing/glacier work, but i've also never held onto anything with my left had for 90 minutes straight before. you see, moving all the safety ropes around, was all done with my right hand, so my left had was basically working 100% duty cycle, while my right hand was maybe 50-70% duty cycle.
Technically it was one of the simplest climbs i've done, it was very straight forward. But it also easily takes the cake for the most strenuous, especially when you figure that hike in and out.

:)

Hank wrote:Dave,

How did you advance your rope up the tree Saturday?

Did you toss it over new branches as you went up making
a number of small climbs interrupted by rope resettings?

About how long did the complete climb up the tree take?

Hank

Bill, you don't really have to worry about spam from YahooGroups on our
list. With 593 messages generated from the group last month, a spam would
easily get lost '-) wink and grin...

I'd love to see them, but no way in heck I'm gonna sign up for all the spam
from YahooGroups.

I'm running off memory from when this whole fracas hit the fan years ago, but I beleive that GIF (Graphic Interchange Format) was developed for (by?) Compu$erve for their online pictures. However, it became extremely popular over time. Compu$erve decided to start charging on their license when they saw the large number of freeware, shareware, and commercial programs out there using it. Like any good business, they thought, hey, here's another revenue source. However, there was such an uproar over it that in essence, Compu$erve dropped the idea of charging for the GIF due to the backlash. Though they retain the license (and patent?) on GIF, the use of it is essentially public domain. Anyone can use it and you don't have to pay to use it. What you may have to pay for is the picture itself, not all pictures are royalty free. That is, you're paying for the use of the picture, not the use of the picture format. It's always a good idea to get (written) permission from the photographer or owner of the picture if you want to use it.

I'll not comment more on the topic of JPEG (Joint Photographic Experts Group) vs GIF, other than to say that the general recommendation, especially with web pages, is "GIFs are best for displaying noncontinuous-tone images, or those with large areas of flat colors. JPEG is the superior format for photographic or continuous-tone images, because they can contain millions of colors."

JPEG files tend to be larger than GIF and PNG (Portable Network Group) files. PNG is the native file format of Macromedia Fireworks, retaining all the original layer, vector, color, and effects information (such as a drop shadow, and all elements are fully editable at all times.

One problem with the GIFs however, is they have a very restrictive licensing agreement. I have a feeling that it is seldom enforced by the number of freeware/shareware software vendors that include the format, but technically any program that saves GIF files is required to pay some organization a sizable chunk of change - if memory serves me, this chunk is somewhere on the order of $100 per software client (i.e. $100 for every copy of PhotoShop sold).
